possible never ending nature of a data stream the amount of data to be processed is likely to be unbounded In addition timely detection of interesting changes or patterns or aggregations over incoming data is critical for many of these applications Furthermore the data arrival rates may fluctuate over a period of time and may be bursty at times For most of these applications Quality of Service or QoS requirements such as response time memory usage and throughput are extremely important These application requirements make it infeasible to simply load the incoming data streams into a persistent store and process them effectively using currently available database management techniques
