Code/Space Rob Kitchin, Martin Dodge, 2014-01-10 An analysis of the ways that software creates new spatialities in everyday life from supermarket checkout lines to airline flight paths After little more than half a century since its initial development computer code is extensively and intimately woven into the fabric of our everyday lives From the digital alarm clock that wakes us to the air traffic control system that guides our plane in for a landing software is shaping our world it creates new ways of undertaking tasks speeds up and automates existing practices transforms social and economic relations and offers new forms of cultural activity personal empowerment and modes of play In Code Space Rob Kitchin and Martin Dodge examine software from a spatial perspective analyzing the dyadic relationship of software and space The production of space they argue is increasingly dependent on code and code is written to produce space Examples of code space include airport check in areas networked offices and cafés that are transformed into workspaces by laptops and wireless access Kitchin and Dodge argue that software through its ability to do work in the world transduces space Then Kitchin and Dodge develop a set of conceptual tools for identifying and understanding the interrelationship of software space and everyday life and illustrate their arguments with rich empirical material And finally they issue a manifesto calling for critical scholarship into the production and workings of code rather than simply the technologies it enables a new kind of social science focused on explaining the social economic and spatial contours of software

Propulsion and Power Joachim Kurzke, Ian Halliwell, Robert Hill, 2025-04-15 This book is for students teachers and practicing engineers and describes an industrial approach to gas turbine engine simulation mainly for aircraft propulsion The principles of performance model creation are covered and the viability and accuracy of model based performance analyses are demonstrated by their application to real

world examples where measured data are scarce Clear distinctions are made between design and off design models the keys to success being the recognition of the importance of scaling and validating compressor and turbine maps This topic is discussed in more detail than in other sources New descriptions of turbomachinery basics are offered and it is shown how velocity diagrams can capture the quality of a compressor or turbine stage and the effects of changes Non dimensional performance is explained in an unusual way without referring to higher mathematics The influence of inlet flow distortion and heat transfer on engine operability during transient operation is also characterized This second edition contains new material about engine starting and windmilling supported by how to extend existing compressor and turbine maps down to speeds as low as 1% Unique material on map interpretation is included The design and operation of hybrid propulsion systems are also addressed Not only a valuable engineering textbook but also a good read **Human-Computer**
