

Aircraft loads is the science of determining the loads that an aircraft structures must be designed to withstand. A large part of the forces that make up design loads are the forces resulting from the flow of air about the airplane's surfaces – the same forces that enable flight and control of the aircraft.

AIRCRAFT EXTERNAL LOADS

Aircraft External loads are generally defined as those forces and loads applied to the aircraft structural components to establish the strength level of the complete aircraft. The strength level, or structural criteria, is defined by the aircraft speed, load factors, and maneuvers the aircraft must be capable of performing.

- 1. Component and payload weight
- 2. Air loads: lift, drag, thrust
- 3. Acoustic Loads
- 4. Thermal Loads
- 5. Landing Loads: touchdown, arresting
- 6. Take-off loads: runway taxi, catapult, assisted (e.g. lift)

The concept of the load factor or g-force is used to describe inertia loads created by acceleration and resisted by the structural components to keep it acting as a unit.

How do we compute inertia loads?
