- 1 A student investigates a wind turbine, which is an electrical generator driven by a propeller blade. Plan an experiment which will enable him to investigate how the current in a resistor connected across the terminals of the turbine varies with the speed of the air flow through the turbine.

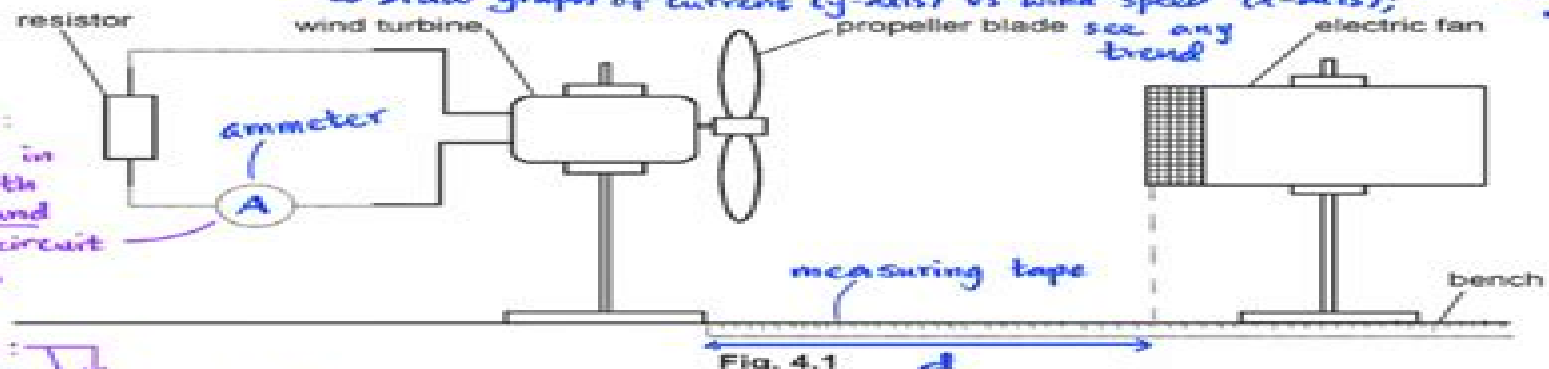

The apparatus available includes:

- a model wind turbine as shown in Fig. 4.1
- an electric fan to provide the moving air to turn the turbine
- a device for measuring air speed.

In your plan, you should:

- list any additional apparatus needed ✓
- complete the wind turbine circuit diagram on Fig. 4.1 ✓
- state the key variables to be kept constant → distance betw. fan & turbine, angle of fan, resistance of resistor, no other wind in env.
- explain briefly how to carry out the experiment, including how the speed of the air flow is to be changed → By changing fan speed setting
- explain how to use the readings to reach a conclusion.

→ Draw graphs of current (y-axis) vs wind speed (x-axis); see any trend

1 mark: Ammeter in series with resistor and correct circuit symbol

1 mark: Ammeter and way to measure independent variable

Additional apparatus: Ammeter, measuring tape, protractor

To change speed of air flow: Change speed settings on electric fan

Variables to keep constant: - Angle between fan and turbine

- Distance (d) between fan and turbine

- Resistance of resistor

- No other wind in environment (closed room)

For any 1 of these, or height of fan/turbine; if distance varied, keep fan speed and angle of fan / angle of air flow constant
