Recent Advances in Clinical Trial Design and Analysis Peter F. Thall, 2012-12-06 Clinical trials have two purposes to treat the patients in the trial and to obtain information which increases our understanding of the disease and especially how patients respond to treatment Statistical design provides a means to achieve both these aims while statistical data analysis provides methods for extracting useful information from the trial data Recent advances in statistical computing have enabled statisticians to implement very rapidly a broad array of methods which previously were either impractical or impossible Biostatisticians are now able to provide much greater support to medical researchers working in both clinical and laboratory settings As our collective toolkit of techniques for analyzing data has grown it has become increasingly difficult for biostatisticians to keep up with all the developments in our own field Recent Advances in Clinical Trial Design and Analysis brings together biostatisticians doing cutting edge research and explains some of the more recent developments in biostatistics to clinicians and scientists who work in clinical trials

Fuzzy Model Identification Hans Hellendoorn, Dimitar Driankov, 2012-12-06 During the past few years two principally different approaches to the design of fuzzy controllers have emerged heuristics based design and model based design The main motivation for the heuristics based design is given by the fact that many industrial processes are still controlled in one of the following two ways The process is controlled manually by an experienced operator The process is controlled by an automatic control system which needs manual on line trimming of its parameters by an experienced operator In both cases it is enough to translate in terms of a set of fuzzy if then rules the operator's manual control algorithm or manual on line trimming strategy in order to obtain an equally good or even better wholly automatic fuzzy control system This implies that the design

of a fuzzy controller can only be done after a manual control algorithm or trimming strategy exists It is admitted in the literature on fuzzy control that the heuristics based approach to the design of fuzzy controllers is very difficult to apply to multiple input/multiple output control problems which represent the largest part of challenging industrial process control applications Furthermore the heuristics based design lacks systematic and formally verifiable tuning techniques Also studies of the stability performance and robustness of a closed loop system incorporating a heuristics based fuzzy controller can only be done via extensive simulations
