Scientific Study from the year 2018 in the subject Chemistry Anorganic Chemistry grade 10 language English abstract Nanoscience is the study of phenomena exhibited by materials at atomic molecular and macromolecular levels of dimensions ranging from a few nanometres to less than a hundred nanometres In chemistry this size range has been associated with colloids micelles polymer molecules and similar structures In physical and electrical engineering nanoscience is often associated with quantum behaviour and electron behaviour in nanoscale structures The area of research in the field of nanotechnology is as diverse as physics chemistry material science microbiology biochemistry and also molecular biology The interface of nanotechnology in combination with biotechnology and biomedical engineering has emerged with the use of nanoscale structures in diagnosis gene sequencing and drug delivery Nanoparticles have attracted great interest in recent years because of their unique chemical and physical properties which are different from those of either the bulk materials or single atoms Nanostructure materials have potential applications in ceramics optoelectronics and catalysis Research on the synthesis of nanomaterials using metal complexes as precursors have been less reported Application of metal complexes as precursors may be helpful to control the physical properties of metal nanoparticles In the last few years researchers have characterized the tunable properties by altering the nanostructure size shape and chemical composition and have developed

reproducible strategies to make nanostructures of desired properties It has been already proved that by controlling the size of the particle and manipulating surface structures of the semiconductor materials the electronic magnetic mechanical and chemical properties can be modified to suit a wide range of device application in many fields The present book deals with the synthesis of Schiff base complexes of Cd II Zn II and Hg II with different sulphur containing ligand and preparation of metal sulphide nanoparticle by the thermal decomposition of complex precursor During this academic journey four new sulphur containing ligands and their thirty complexes were synthesized These ligands and complexes were characterized by spectroscopic methods like UV Vis FT IR 1H NMR 13C NMR 2D NMR FAB MS ESI Ms spectra **American Book**

, 1958 Nucleic Acids Irshad Ul Haq Bhat, Zakia Khanam, 2023-08-20 Nucleic Acids A Natural Target for Newly Designed Metal Chelate Based Drugs discusses how human diseases are becoming more costly to treat along with updates on the resistance offered by disease causing agents The abundance of drugs in the market has provided great relief to patients but side effects can destroy the immune system of the body Patients need to boost their immune system and at the same time cover expenses incurred to cure disease Thus a paradigm shift is needed to design a drug molecule with low cost and easy availability Metal complexes can be a great example of such a shift as metal ions are components of biological molecules and can achieve good binding capability to specific targets while not allowing them to damage healthy cell system Therefore in this book a comprehensive compilation of recent data is provided including the structural elucidation of metal complexes by advanced techniques and the binding pattern of metal complexes with specific targets Focuses on recent advances and methods adopted for generating new metal based molecules and their interactions with biomolecules especially nucleic acids Addresses challenges for developing new metal based drugs Examines advances in optical techniques for the characterization of metal based drugs
