Gilliam, 2014 **The Gilliam Autism Rating Scale** James E. Gilliam, 1995 Cet instrument de mesure est utilisé auprès de personnes autistes âgées entre 3 et 22 ans et qui rencontrent des problèmes de comportements importants Le but de cet instrument est d'aider les professionnels poser un diagnostic d'autisme et il peut être compilé par quiconque a des contacts directs et continus avec un individu enseignants parents intervenants personnes significatives Il se base sur la définition de l'autisme donnée par l'Autism Society of America que l'on retrouve dans le Diagnostic and Statistical Manual of Mental Disorders Fourth Edition DSM IV de l'American Psychiatric Association et donne des informations sur l'autisme et les critères de diagnostic Factor Analyses and Clinical Discriminant Validity of the Gilliam Autism Rating Scale - 3rd Edition (gars-3) Using Special Education Staff Ratings in Samples with Autism Spectrum Disorder and Other Developmental Disabilities Nicole Bergamo Isbell, 2022 Based on Center for Disease Control and Prevention CDC surveillance reports the prevalence of autism spectrum disorder ASD continues to increase Maenner et al 2021 As such assessment tools that are efficient cost effective and psychometrically sound are key to effective screening accurate diagnosis and clarification of intervention needs Kuriakose Zwaigenbaum Gilliam 2013 a substantial revision from earlier editions is a rating scale used to gather information from parents caregivers or teachers for screening or as part of a more comprehensive ASD assessment Across editions the GARS is considered a popular assessment tool among school psychologists e.g. Aiello et al 2017 Benson et al 2019 However despite the strong psychometric characteristics reported in the test manuals with standardization samples prior editions were criticized for their screening performance in

independent research samples and factor analyses suggested problems with the test author's proposed subscales e.g. Lecavalier 2005, Pandolfi et al 2010, South et al 2002, Volker et al 2016, Volker et al 2022. To date there has been little to no research focused on the psychometric properties of the current version of the GARS beyond what is reported in the test manual. Of critical importance there have been no published independent factor analyses conducted in ASD or broader developmental disability samples and no independent estimates of screening effectiveness or clinical discriminant validity of the GARS 3. Therefore the present project seeks to add to the limited research regarding the GARS 3 using program evaluation data from a large special education agency in Western New York state. The project consisted of three different studies that addressed aspects of GARS 3 internal structure validity and clinical discriminant validity. Study one involved an exploratory factor analysis (EFA) of the GARS 3 items with an ASD sample (n = 204) rated by special education teaching staff. Study two confirmatory factor analyses (CFA) using a second ASD and non-ASD developmental disabilities (DDs) sample (n = 200) were used to examine the model fit of the published GARS 3 model and the factor model derived from the study one EFA and assess which of the two models better fit the sample covariance matrix. Finally, aspects of the GARS 3's clinical discriminant validity were assessed using unique ASD cases from studies one and two (ASD sample n = 226) and an additional non-ASD developmental disabilities sample (non-ASD DDs sample n = 64) from the same special education agency. Clinical discriminant validity was examined via between-group comparisons, classification accuracy of a predetermined cut score, and exploration of other possible cut scores using receiver operator characteristic (ROC) curve analyses. The EFA resulted in a six-factor solution that was very similar in structure to the GARS 3 published six-factor model, differing only in the placement of one item. The CFAs indicated that the GARS 3 published model and the EFA-derived model both fit the data well and did not substantively differ. However, when cross-loadings were added based on EFA results, CFA model fit significantly improved. ROC curve analyses indicated that when using the suggested cut score of 70, sensitivity and specificity were lower than predicted. Lower cut scores yielded good sensitivity but poorer specificity, while higher cut scores showed the opposite pattern. Discussion and recommendations pertained to examining items and subscales based on cross-loadings and inter-factor correlations, in addition to clinical implications of sensitivity and specificity findings.

Exploratory Factor Analysis of the Gilliam Autism Rating Scale - Second Edition with a Sample of Students with Autism Spectrum Disorders

Elissa H. Dua, 2014. The Gilliam Autism Rating Scale Second Edition (GARS 2; Gilliam, 2006) is a widely used screening tool that assists in the identification and diagnosis of autism spectrum disorders (ASDs). Although this assessment measure is commonly used during autism assessments, there has been little research on its psychometric properties. The purpose of this study was to examine the factor structure, internal consistency, and screening sensitivity of GARS 2 ratings completed by special education teaching staff for a sample of students (N = 216) with autism spectrum disorders. The exploratory factor analysis supported the retention of three factors labeled Stereotyped and Repetitive Behaviors, Social Avoidance and Withdrawal, and

Atypical Language and Communication These three factors were very similar to those found in prior research by Lecavalier 2005 on the original GARS and Volker et al under review using the GARS 2 with a more mixed developmental disabilities sample In the present study internal consistency estimates met or exceeded standards for screening and were generally higher than those in previous studies Using an Autism Index cut score of 85 yielded a screening sensitivity of 5879 while a cut score of 90 yielded a sensitivity of 4537 These sensitivity results were generally similar to those of prior studies involving the GARS or GARS 2 It is noteworthy that the three factor solution retained in the present study matches very closely with those from two prior studies with different samples i e Lecavalier 2005 Volker et al under review suggesting the presence of a robust three factor structure However this factor structure was different from the four factor structure found by Pandolfi Magyar and Dill 2010 using the GARS 2 standardization sample Although this study provides some psychometric support for the use of the GARS 2 as a screening tool the sensitivity estimates for the Autism Index suggest that the instrument results in a high percentage of false negative results for ASD This significantly limits the GARS 2 s utility and along with the factor analytic results suggests the need to substantially revise the instrument Implications for instrument revision and future research are provided Gilliam Autism Rating Scale James E. Gilliam, 1996* **Gilliam Autism Rating Scale** James E. Gilliam, 2014 *The Diagnostic Accuracy of New Subjective Rating Scales for Autism Spectrum Disorder* Amy Langenderfer, 2019 Autism spectrum disorder ASD is a developmental disorder characterized by deficits in 1 social communication and interaction and 2 restricted repetitive patterns of behavior interests or activities Historically it was considered a rare condition but is currently estimated to affect about 1% of the population both in the United States and worldwide American Psychiatric Association APA 2013 Wing Potter 2002 The fifth edition of the Diagnostic and Statistical Manual of Mental Disorders DSM 5 changed the diagnostic criteria by eliminating the categories of autistic disorder Asperger s disorder and pervasive developmental disorder and using the spectrum diagnosis to cover all the categories With

this change in the DSM 5 some of the subjective rating scales were updated to better match the new criteria Two of these scales are the Gilliam Autism Rating Scale GARS and the Autism Spectrum Rating Scales ASRS There have been very few studies investigating the diagnostic accuracy of these scales under the new criteria Subjective rating scales are widely used in determining diagnoses so the accuracy of these scales is important to understand and clarify The current quantitative study sought to investigate the diagnostic accuracy of the GARS 3 compared to the GARS 2 as well as the updated ASRS Participants were individuals 2 to 22 years of age whose parents and or teachers have completed the GARS 2 GARS 3 and or ASRS at 2 outpatient clinics in the Midwestern United States In a preliminary analysis presented at the 2017 American Academy of Pediatric Neuropsychology conference both the GARS 3 and ASRS had fair to high sensitivity but poor specificity Langenderfer et al 2017 Therefore though the GARS 3 and ASRS were found to correctly classify children with ASD they also overpathologize children with other mental health conditions using the recommended cutoff scores for both the Total Score and most of the individual subscales Langenderfer et al 2017 However some subscales on both measures showed promise in terms of differentiating groups Langenderfer et al 2017 Keywords autism spectrum disorder Gilliam Autism Rating Scale Autism Spectrum Rating Scales **Gilliam Autism Rating Scale - 2nd Edition** Amy Diachenko Foster,2006 **GARS-3** James E.
