W. Glaspell, 2022 Linear friction welding LFW is a solid state joining process that is increasingly gaining interest in its use for bonding dissimilar metals The parameters necessary for successful bonding are not well understood for various dissimilar metal combinations Laser welding LW is also a solid state joining process that has gained interest for joining shape memory alloys to other metals Similarly the parameters needed for bonding these dissimilar metals are not well documented Understanding what parameters are necessary for joining is essential for advancing knowledge in this field This thesis focuses on the development and validation of computational models to address this issue A 2D numerical and computational model was developed for the LFW while a 2D thermal and a 3D structural computational model was developed for the LW The numerical model was developed using MATLAB while the computational models were developed using the finite element analysis software ANSYS Workbench The models were validated with experimental data taken during the experimental welding The results showed for LFW increasing frictional heat flux and pressure increased deformation while for LW increasing laser power increased deformation and increasing thickness decreased deformation In conclusion the aims of this thesis were successfully addressed thus increasing understanding of both the LFW and LW processes The work showed the implicit decoupled 2D models can capture results necessary for parametric and geometric studies The work also has a deeper insight into the necessary process parameters needed for successful bonding on dissimilar metals under both linear friction and laser welding
