

1.1 Geological Maps and Cross sections

Topographic maps

- Show elevation above datum (usually sea-level)
- Geomorphological and anthropogenic features shown

Geological maps

- Show distribution of rock types exposed on surface
- Use different line symbols and rock boundaries to show rock related to each other
- Rock bodies are three dimensional -> extend beneath the surface
- Geologists interpret how this might happen and construct cross-section (inferred geological in vertical slices through the Earth)
- All geological maps should have
 - o Title, author, date
 - o Orientation, north arrow
 - o Scale, coordinate system, grid squares
 - o Legend and geology

Colour schemes

- Rock types are 'grouped' into units with similar characteristics and usually, different colours are distinguished between **OR** rock formations of different age ie chronologically according to the subdivisions of the geological timescales

Rule of 'V's

- 1) Horizontal layers follow contours of topographic exactly "as if they are bound by the imaginary lines"
- 2) Vertical layers cut across topography without deflection, appears straight on a map
- 3) Layers that dip in the upstream direction, form an upstream directed 'v' on the map
