Serial ATA Storage Architecture and Applications Knut Grimsrud,Hubbert Smith,2003 Today hard disk drives for desktop PCs laptops servers and storage appliances use either Parallel ATA or SCSI interconnect technology Serial ATA is the new storage interconnect standard for these systems Computer engineers and architects who plan to incorporate Serial ATA in new products must answer questions such as Why make the change What problems does Serial ATA solve for me How do I transition from Parallel ATA to Serial ATA and from SCSI to Serial ATA This book helps you answer these questions If you are a systems engineer product architect or product line manager you could be asked to contribute to the planning process for a transition to Serial ATA This book provides you with reliable information in sufficient technical depth to help you implement the Serial ATA specifications Topics include PHY signaling and interface states protocol encoding programming model flow control performance compatibility with legacy systems enclosure management signal routing hot plug presence detection activity indication power management and cable connector standards

Embedded Systems Design with Platform FPGAs Ronald Sass,Andrew G. Schmidt,2010-09-10 Embedded Systems Design with Platform FPGAs introduces professional engineers and students alike to system development using Platform FPGAs The focus is on embedded systems but it also serves as a general guide to building custom computing systems The text describes the fundamental technology in terms of hardware software and a set of principles to guide the development of Platform FPGA systems The goal is to show how to systematically and creatively apply these principles to the construction of application specific embedded system architectures There is a strong focus on using free and open source software to increase productivity Each chapter is organized into two parts The white pages describe concepts principles and general knowledge The gray pages provide a technical rendition of the main issues of the chapter and show the concepts applied in practice This includes step by step details for a specific development board and tool chain so that the reader can carry out the same steps on their own Rather than try to demonstrate the concepts on a broad set of tools and boards the text uses a single set of tools Xilinx Platform Studio Linux and GNU throughout and uses a single developer board Xilinx ML 510 for the examples Explains how to use the Platform FPGA to meet complex design requirements and improve product performance Presents both fundamental concepts together with pragmatic step by step instructions for building a system on a Platform FPGA Includes detailed case studies extended real world examples and lab exercises

UPnP Design by Example Michael Jeronimo,Jack Weast,2003 Computer network devices need to be as easy for consumers to set up as stereo equipment Universal Plug and Play UPnP is the technology that can make this happen This book is primarily a software developer s guide for enabling UPnP but it also provides a great introduction for those new to the technology

Designing High-performance and Scalable Clustered Network Attached Storage with Infiniband Ranjit Mario Noronha,2008 Abstract The Internet age has exponentially increased the volume of digital media that is being shared and distributed Broadband Internet has made technologies such as high quality streaming video on demand possible Large scale supercomputers also consume and create huge quantities of data This media and data must be stored cataloged and retrieved with high performance Researching high performance storage subsystems to meet the I O demands of applications in modern scenarios is crucial Advances in microprocessor technology have given rise to relatively cheap off the shelf hardware that may be put together as personal computers as well as servers The servers may be connected together by networking technology to create farms or clusters of workstations COW The evolution of COWs has significantly reduced the cost of ownership of high performance clusters and has allowed users to build fairly large scale machines based on commodity server hardware As COWs have evolved networking technologies like InfiniBand and 10 Gigabit Ethernet have also evolved These networking technologies not only give lower end to end latencies but also allow for better messaging throughput between the nodes This allows us to connect the clusters with high performance interconnects at a relatively

lower cost With the deployment of low cost high performance hardware and networking technology it is increasingly becoming important to design a storage system that can be shared across all the nodes in the cluster Traditionally the different components of the file system have been strung together using network connections The protocol generally used over the network is TCP IP The TCP IP protocol stack in general has been shown to have poor performance especially for high performance networks In this dissertation we research the problem of designing high performance communication subsystems for network attached storage NAS systems Specifically we delve into the issues and potential solutions with designing communication protocols for high end single server and clustered server NAS systems Orthogonally we also investigate how a caching architecture may potentially enhance the performance of a NAS system Finally we look at the potential performance implications of using some of these designs in two scenarios over a long haul network and when used as a basis for checkpointing parallel applications

Beyond Storage Interfaces Jun He,2019 Efficient interactions between the software and storage devices are essential for achieving high performance in data processing systems However efficient interacting is challenging because such interactions are beyond the storage interfaces complying with the specifications of the interfaces which we call written contracts does not guarantee high performance To achieve high performance clients of storage devices must follow an additional set of implicit rules which we call unwritten performance contracts The specific unwritten performance contract of a device depends on its internal architecture Violating the contract lowers the performance of the data processing system As a result we must find violations of the unwritten contract and exploit the contract to achieve high performance We start by finding violations of the unwritten contracts for HDDs and SSDs respectively First we study the methodologies for finding violations of the HDD unwritten contract by using statistical methods e g Latin hypercube sampling and Sensitivity Analysis Our study finds and fixes four design issues in a popular file system Linux ext4 Second we find violations of the SSD unwritten contract by full stack analysis of modern applications file systems and SSD FTLs We begin by formalizing the rules of the SSD unwritten contract we then conduct analysis to uncover application and file system designs that violate the contract As a result we make numerous interesting observations that could shed light upon the future storage system designing Finally we exploit the unwritten contract of SSDs to build a cost effective and high performance data processing system To this end we propose Tiny Memory Processing Systems TMPS which exploit fast and cheap SSDs to reduce expensive memory To study the TMPS approach we build a complete search engine that employs careful designs in data layout early pruning prefetching and space traffic tradeoffs When compared with a state of the art search engine in a tiny memory configuration our search engine reduces I O amplification by up to 3.2 times query latency by up to 16 times and increases the query throughput by up to 2.9 times
