Combating Fungal Infections Iqbal Ahmad, Mohammad Owais, Mohammed Shahid, Farrukh Aqil, 2010-08-03 Fungi are eukaryotic microorganisms that are closely related to humans at cellular level Human fungal pathogens belong to various classes of fungi mainly zygomycetes ascomycetes basidiomycetes and deuteromycetes In recent years fungal infections have dramatically increased as a result of improved diagnosis high frequency of catheterization instrumentation etc However the main cause remains the increasing number of immunosuppressed patients mostly because of HIV infection and indiscriminate usage of antineoplastic and immunosuppressive agents broad spectrum antibiotics and prosthetic devices and grafts in clinical settings Presently available means of combating fungal infections are still weak and clumsy compared to control of bacterial infection The present scenario of antifungal therapy is still based on two classes of antifungal drugs polyenes and azoles These drugs are effective in many cases but display toxicity and limited spectrum of efficacy The recent trend towards emergence of drug resistant isolates in the clinic is an additional problem In recent years a few new antifungal drugs have entered the clinics but they are expected to undergo same fate as the older antifungal drugs The application of fungal genomics offers an unparalleled opportunity to develop novel antifungal drugs However it is too early to expect any novel drugs as the antifungal drug discovery program is in the stage of infancy Interestingly several novel antifungal drug targets have been identified and validated

Human and Animal Relationships Axel A. Brakhage, Peter F Zipfel, 2008-07-20 Pathogenic fungi are widely distributed and can infect many organisms particularly humans but also other vertebrates and insects Due to a growing number of fungal infections there is an increasing need to understand the interaction of pathogenic fungi with their hosts This second completely updated and revised edition of Volume VI of *The Mycota* consists of state of the art reviews written by experts in the field covering three major areas of this rapidly developing field In the first part the current understanding of pathogenic fungi and the physiological reactions relevant for the pathogen host interaction are elucidated The second part describes novel technologies for the identification of proteins virulence factors and mechanisms central to the host pathogen interaction The third part deals with the characterization of the host response towards pathogenic fungi and addresses timely clinical aspects
