

Simulink/Matlab-to-VHDL: Route for Full-Custom/FPGA Rapid Prototyping of DSD Algorithms

Arnar KHURKOWSKI and Janet KALE

University of Westminster, United Kingdom.

Abstract

This paper presents the way of specifying an the route from the behavioural design with Simulink/Matlab, via behavioural simulation in fixed-point arithmetic to the implementation in either FPGA or custom silicon. This has been achieved by proving the merit of the Simulink system description over the VHDL. At the first instance, the Simulink-to-VHDL converter has been designed to use structural VHDL code to describe various subsystems, allowing simple behavioural descriptions for basic blocks. The resulting VHDL code describes various results when compared to the equivalent fixed-point Simulink model simulations.

1. Introduction

However, the success of VHDL for designing integrated circuits is questionable. Unfortunately there is a lack of tools available making VHDL, much more high-level digital logic design/simulation tools like Matlab^[1] and Simulink^[2], which operate on the levels higher than the circuit. At the moment the designer who designed and tested his design theoretically using high-level tools is required to spend the same or more time on designing the structure and the architecture for his theoretical design, sometime it can be tedious. This involves a dangerous break in the integrity of design flow, giving reasons for inconsistency to creep in. An international high-integrity link between theoretical design and implementation is essential and can be achieved with VHDL via a conversion tool. A very attractive high-level design/simulation tool is provided by MathWorks^[3] and is called Simulink^[4]. It is a very flexible design tool, which allows testing of a high-level structural description of the design and makes possible quick changes and corrections. The circuit description structure is very similar to the way the design could be implemented later. Therefore mapping tool allowing conversion of such a structure into VHDL code would save the designer's time, which otherwise has to be spent on creating the same structure in VHDL, and probably making mistakes that will need debugging. This idea is the basis of

the work described in this paper.

Primarily, the work has been concentrated on the analysis of the Simulink^[5] structure and its similarity with the VHDL description. The structural style of programming has been chosen for the first version of our synthesizer tool, as this would allow direct mapping of Simulink^[5] structures into ones described in VHDL. As Simulink^[5] is a high-level description tool and allows such operations as unconstrained arithmetic operations, the behavioural style will be included in the next version of the converter tool. The ultimate tool to be developed will also allow incorporation of some form of simple optimisation into the mapping process.

2. Basics of VHDL

VHDL stands for Very High Speed Integrated Circuit (VHSIC) Hardware Description Language (VHDL). It is a language for describing digital electronic systems. It was born out of the United States Government's VHDL program in 1983 and was adopted as a standard for describing the structure and function of integrated circuits (IC's). Soon after it was developed and adopted as a standard by the Institute of Electrical and Electronic Engineers (IEEE) in the US (IEEE-1076-1987) and in other countries (11/2). VHDL continues to evolve. Although new standards have been prepared (VHDL-93) more commercial VHDL tools use 1076-1987 version of VHDL, thus making it the most compatible when using different compilation tools. The 1076-1987 standard has also been used here.

VHDL enables the designer to:

- Describe the design in its entirety, or specify how it is decomposed into sub-designs, and how these sub-designs are interconnected.
- Specify the functions of design using a familiar, C-like programming language form.
- Simulate the design before creating it off for fabrication, so that the designer has a chance to rapidly compare alternative approaches and test for corrections without the delay and expense of multiple prototyping.

VHDL is a C-like, general purpose programming language with constructs to model both concurrent and
