Precoding Techniques for Digital Communication Systems C.-C. Kuo, Shang-Ho Tsai, Layla Tadjpour, Yu-Hao Chang, 2008-09-18 During the past two decades many communication techniques have been developed to achieve various goals such as higher data rate more robust link quality and more user capacity in more rigorous channel conditions The most well known are for instance CDMA OFDM MIMO multiuser OFDM and UWB systems All these systems have their own unique superiority while they also induce other drawbacks that limit

the system performance. Conventional way to overcome the drawback is to impose most of the computational effort in the receiver side and let the transmitter design much simpler than receiver. The fact is that however by leveraging reasonable computational effort to the transmitter the receiver design can be greatly simplified. For instance multiaccess interference (MAI) has long been considered to limit the performance of multiuser systems. Popular solutions to mitigate MAI issue include multiuser detection (MUD) or sophisticated signal processing for interference cancellation such as PIC or SIC. However those solutions impose great burden in the receiver. In this case precoding offers good solutions to achieve simple transceiver designs as we will mention later in this book. This book is intended to provide a comprehensive review of precoding techniques for digital communications systems from a signal processing perspective. The variety of selected precoding techniques and their applications makes this book quite different from other texts about precoding techniques in digital communication engineering.

Mobile Multimedia Broadcasting Standards Fa-Long Luo, 2008-11-06. Mobile multimedia broadcasting compasses a broad range of topics including radio propagation, modulation and demodulation, error control, signal compression and coding, transport and time slicing, system on chip, real time implementation in hardware, software and system levels. The major goal of this technology is to bring multimedia enriched contents to handheld devices such as mobile phones, portable digital assistants and media players through radio transmission or internet protocol (IP) based broadband networks. Research and development of mobile multimedia broadcasting technologies are now explosively growing and regarded as new killer applications. A number of mobile multimedia broadcasting standards related to transmission, compression and multiplexing now coexist and are being extensively further developed. The development and implementation of mobile multimedia broadcasting systems are very challenging tasks and require the huge efforts of the related industry, research and regulatory authorities so as to bring the success. From an implementation, design and engineering practice point of view, this book aims to be the first single volume to provide a comprehensive and highly coherent treatment for multiple standards of mobile multimedia broadcasting by covering basic principles, algorithms, design trade off and well compared implementation system examples. This book is organized into 4 parts with 22 chapters.

Frequency-Domain Multiuser Detection for CDMA Systems

Paulo Silva,Rui Dinis,2022-09-01 Future broadband wireless communication systems are expected to be able to offer new and powerful services enabling fast transmission rates of several tens of Mbit/s. This is an ambitious challenge especially for mobile communication systems since these systems should be able to cope with severely time dispersive channels associated to the signal multipath propagation. Moreover these systems should have high spectral and power efficiencies as well as high capacity and flexibility. Spread spectrum techniques particularly coded division multiple access CDMA techniques allow high capacity and flexibility continuous transmission requiring low peak power requirements for the amplifiers as well as some robustness against fading and time dispersion effects associated with the multipath propagation. When employed in prefix assisted PA block transmission schemes combined with frequency domain receiver implementations they become especially interesting for broadband wireless systems. In Frequency Domain Multiuser Detection for CDMA Systems the use of PA block transmission is considered in the context of both DS Direct Sequence and MC Multicarrier CDMA schemes. The main goal is the study of frequency domain multiuser detection techniques with iterative signal detection decoding techniques also in combination with estimation and cancelation of nonlinear distortion effects. The receiver structures are suitable to scenarios with high interference levels and strongly time dispersive channels.
