Screening Angela Dean, Susan Lewis, 2006-07-28 The process of discovery in science and technology may require investigation of a large number of features such as factors genes or molecules In Screening statistically designed experiments and analyses of the resulting data sets are used to identify efficiently the few features that determine key properties of the system under study This book brings together accounts by leading international experts that are essential reading for those working in fields such as industrial quality improvement engineering research and development genetic and medical screening drug discovery and computer simulation of manufacturing systems or economic models Our aim is to promote cross fertilization of ideas and methods through detailed explanations a variety of examples and extensive references Topics cover both physical and computer simulated experiments They include screening methods for detecting factors that affect the value of a response or

its variability and for choosing between various different response models Screening for disease in blood samples for genes linked to a disease and for new compounds in the search for effective drugs are also described Statistical techniques include Bayesian and frequentist methods of data analysis algorithmic methods for both the design and analysis of experiments and the construction of fractional factorial designs and orthogonal arrays The material is accessible to graduate and research statisticians and to engineers and chemists with a working knowledge of statistical ideas and techniques It will be of interest to practitioners and researchers who wish to learn about useful methodologies from within their own area as well as methodologies that can be translated from one area to another

Montgomery, 2019-11 There are several textbooks covering material in design of experiments DOE It is a fair question then to ask Why write another DOE textbook One answer is based on the observation that in 2018 over a quarter of the DOE courses taught at the university level rely on course notes rather than a text We view this as an evidence of pent up demand for a different kind of textbook than is currently available A characteristic of many DOE textbooks is that they focus as much or more on analysis than on design A student might get the impression that there is only one appropriate design for any scenario and this design should be orthogonal Orthogonal designs have the desirable feature that the analysis of the data generated after running the experiment is less demanding than the analysis of observational data *Design Analysis Experiments 5th Edition with Student Solutions Manual and Student Survey Set* Douglas C. Montgomery, 2004-09 Learn How to Achieve Optimal Industrial Experimentation Through four editions Douglas Montgomery has provided statisticians engineers scientists and managers with the most effective approach for learning how to design conduct and analyze experiments that optimize performance in products and processes Now in this fully revised and enhanced Fifth Edition Montgomery has improved his best selling text by focusing even more sharply on factorial and fractional factorial design and presenting new analysis techniques including the generalized linear model There is also expanded coverage of experiments with random factors response surface methods experiments with mixtures and methods for process robustness studies The book also illustrates two of today's most powerful software tools for experimental design Design Expert r and Minitab r Throughout the text You ll find output from these two programs along with detailed discussion on how computers are currently used in the analysis and design of experiments information for characterization and optimization of systems Improve manufacturing processes Design and develop new processes and products Evaluate material
