transition away from fossil fuels this book is an essential reference for engineering professionals with a specific interest in biodiesel production sustainability renewable energy and environmental conservation *Advanced Data Analysis with SYSTAT* Kris Nolan Kirby, 1993 Economists biologists health care professionals and sociologists looking to do better statistics can confidently turn to this easy to follow guide to using Systat one of the major computer based statistical programs The guide is brimming with helpful hints and practical shortcuts for performing contrast analysis in interaction effect and size of estimation and meta analysis Testing Research Hypotheses with the General Linear Model Keith A. McNeil, Isadore Newman, Francis J. Kelly, 1996 Because the technique of multiple linear regression has been accepted by the research community since 1975 Keith McNeil Isadore Newman and Francis J Kelly devote little space to defending the equivalence of correlational and ANOVA procedures with multiple linear regression Instead they show how the multiple linear regression technique frees the researcher from wondering if an analysis can be done and refocuses him or her back to the central concern the research question itself The first three sections of chapter 1 provide a conceptual research and statistical orientation to the entire text The remainder of chapter 1 furnishes the rationale for the utility of a conceptual model of behavior along with one such model that can be used to identify predictor variables The authors strongly suggest that readers familiar with the general linear model read these three sections before delving into the more advanced material Readers who are relatively unfamiliar with the general linear model should read the first eight chapters before branching off into topics that are of immediate interest Examples are provided throughout the text all using the same data in the same widely available statistical analysis package Although the technique can be taught with matrix algebra the authors use the simpler approach of vector algebra an approach more in line with the way data are conceptualized and entered into the computer All of the correlational statistical techniques are shown to be subsets of the general linear model Of more importance however researchers are encouraged to think beyond these limitations and to ask the research questions they are interested in Thus the common researcher is freed from the shackles of the right statistical procedure and its associated right computer analysis Handbook for Evaluating Knowledge-Based Systems Leonard Adelman, Sharon L. Riedel, 1997-04-30 Knowledge based systems are increasingly found in a wide variety of settings and this handbook has been written to meet a specific need in their widening use While there have been many successful applications of knowledge based systems some applications have failed because they never received the corrective feedback that evaluation provides for keeping development focused on the users needs in their actual working environment This handbook provides a conceptual framework and compendium of methods for performing evaluations of knowledge based systems during their development Its focus is on the users and subject matter experts evaluation of the usefulness of the system and not on the developers testing of the adequacy of the programming code The handbook permits evaluators to systematically answer the following kinds of questions Does the knowledge based system meet the users task requirements Is the system easy to use Is the knowledge

base logically consistent Does it meet the required level of expertise Does the system improve performance The authors have produced a handbook that will serve two audiences a tool that can be used to create knowledge based systems practitioners developers and evaluators and a framework that will stimulate more research in the area academic researchers and students To accomplish this the handbook is built around a conceptual framework that integrates the different types of evaluations into the system of development process The kinds of questions that can be answered and the methods available for answering them will change throughout the system development life cycle And throughout this process one needs to know what can be done and what can't It is this dichotomy that addresses needs in both the practitioner and academic research audiences OSU Statistics Technical Report Ohio State University.
