Analog-to-Digital Conversion Marcel J.M. Pelgrom, 2010-07-24 A book is like a window that allows you to look into the world The window is shaped by the author and that makes that every window presents a unique view of the world This is certainly true for this book It is shaped by the topics and the projects throughout my career Even more so this book reflects my own style of working and thinking That starts already in Chap 2 When I joined Philips Research in 1979 many of my colleagues used little paper notebooks to keep track of the most used equations and other practical things This notebook was the beginning for Chap 2 a collection of topics that form the basis for much of the other chapters Chapter 2 is not intended to explain these topics but to refresh your knowledge and help you when you need some basics to solve more complex issues In the chapters discussing the fundamental processes of conversion you will recognize my preoccupation with mathematics I really enjoy finding an equation that properly describes the underlying mechanism Nevertheless mathematics is not a goal in its own the equations help to understand the way the variables are connected to the result Real insight comes from understanding the physics and electronics In the chapters on circuit design I have tried to reduce the circuit diagrams to the simplest form but not simpler I do have private opinions on what works and what should not be applied

Digital-to-analog Converter Interface for Computer Assisted Biologically Inspired Systems

Nicholas Conley Poore, 2014 In today's integrated circuit technology system interfaces play an important role of enabling fast reliable data communications A key feature of this work is the exploration and development of ultra low power data converters Data converters are present in some form in almost all mixed signal systems in particular digital to analog converters present the opportunity for digitally controlled analog signal sources Such signal sources are used in a variety of applications such as neuromorphic systems and analog signal processing Multi dimensional systems such as biologically inspired neuromorphic systems require vectors of analog signals To use a microprocessor to control these analog systems we must ultimately convert the digital control signal to an analog control signal and deliver it to the system Integrating such capabilities of a converter on chip can yield significant power and chip area constraints Special attention is paid to the power efficiency of the data converter the data converter design discussed in this thesis yields the lowest power consumption to date The need for a converter with these properties leads us to the concept of a scalable array of power efficient digital to analog converters the channels of which are time domain multiplexed so that chip area is minimized while preserving performance To take further advantage of microprocessor capabilities an analog to digital design is proposed to return the analog system's outputs to the microprocessor in a digital form A current steering digital to analog converter was chosen as a candidate for the conversion process because of its natural speed and voltage to current translation properties This choice is nevertheless unusual because current steering digital to analog converters have a reputation for high performance with high power consumption A time domain multiplexing scheme is presented such that a digital data set of any size is

synchronously multiplexed through a finite array of converters minimizing the total area and power consumption. I demonstrate the suitability of current steering digital to analog converters for ultra low power operation with a proof of concept design in a widely available 130 nm CMOS technology. In statistical simulation the proposed digital to analog converter was capable of 8 bit 100 kSps operation while consuming 231 nW of power from a 1 V supply.

Radio Frequency Digital to Analog Converter Susan Luschnas, 2003

Dynamic performance of high speed high resolution digital to analog converters DACs is limited by distortion at the data switching instants. Inter symbol interference ISI imperfect timing synchronization and clock jitter are all culprits. A DAC output current controlled by an oscillating waveform is proposed to mitigate the effects of the switching distortion. The oscillating waveform should be a multiple $k f_s$ of the sampling frequency f_s where $k \gg 1$. The waveforms can be aligned so that the data switching occurs in the zero regions of the oscillating output. This makes the DAC insensitive to switch dynamics and jitter. The architecture has the additional benefit of mixing the DAC impulse response energy to a higher frequency. An image of a low IF input signal can therefore be output directly at a high IF or RF frequency for transmit communications applications. A narrow band sigma delta DAC with eight unit elements is chosen to demonstrate the radio frequency digital to analog converter RF DAC concept. A sigma delta architecture allows the current source transistors to be smaller since mismatch shaping is employed. Smaller current source transistors have a lower drain capacitance allowing large high frequency output impedance to be achieved without an extra cascode transistor. Elimination of the cascode reduces transistor headroom requirements and allows the DAC to be built with a 1.8V supply. The RF DAC prototype is targeted to GSM transmit specifications and implemented in 0.18 μm CMOS technology. Measured single tone SFDR is 75dBc SNR is 52dB and IMD3 is 70.8dBc over a 17.5MHz bandwidth centered at 942.5MHz. Measured SNR has the predicted dependence on the phase alignment of the data clock and oscillating pulse.

A Reconfigurable Digital-to-analog Converter with Supply Invariant Linearity Nicholas James Chiolino, 2013 A novel reconfigurable digital to analog converter DAC with supply independent linearity is presented The process agnostic converter achieves wide supply range operation and re configurability by being charge based This converter consists of a 7 bit parallel digital input control core and an analog summing core utilizing charging capacitors with an operational transconductance amplifier in a voltage follower configuration This topology is highly configurable to allow for optimization across process voltages step sizes and low power operation The specification of the DAC is 1 supply independence 2 low power operation 3 operation up to 200 kHz and 4 conversion control through a DAC enable signal Supply independence is achieved through the use of a charge based approach in the analog core utilizing a finite stepping voltage derived from another much smaller voltage reference This voltage reference in turn determines the resolution of the DAC The DAC will thus create a stair stepping analog output until digital input is met or the voltage supply is reached Feedback is utilized when either of these events occurs notifying the DAC to wait until another sample is requested Low power is achieved by using static CMOS logic and the inclusion of a sleep mode in the analog core which can be used after the desired output is achieved This design was implemented across two different processes with different power supplies to confirm the architecture
