CHAPTER 5

TRANSPORTATION, ASSIGNMENT, AND NETWORK MODELS

SOLUTIONS TO DISCUSSION QUESTIONS

5-1. The transportation model is an example of decision making under certainty since the costs of each shipping route, the demand at each destination, and the supply at each source are all assumed to be known with certainty.

5-2. A balanced transportation problem is one in which total demand (from all destinations) is exactly equal to total supply (from all sources). If a problem is unbalanced, either the demand or the supply constraints must be inequalities.

5-3. The enumeration method is not a practical means of solving 5×5 or 7×7 problems because of the number of possible assignments to be considered. In the 5×5 case, there are $5! = (5 \times 4 \times 3 \times 2 \times 1) = 120$ alternatives that need to be evaluated. In the 7×7 case, there are $7! = 5,040$ alternatives.

5-4. The minimal-spanning model is one that will find the best way to connect all the nodes in a network together while minimizing the total distance between nodes or the total cost of connecting the nodes together. A number of decision modeling problems can be solved using this model: an example was given connecting water and power to a real estate development project. This model can also be used to determine the best way to deliver cable TV to households, connect computers on a computer network, install an oil pipeline, develop a natural gas network, and more.

5-5. The maximal-flow model can be used to determine the maximum number of cars that can flow through a road system, the number of gallons of chemicals that can flow through a chemical processing plant, the

Evolutionary Algorithms in Management Applications Jörg Biethahn, Volker Nissen, 2012-12-06

Evolutionary Algorithms EA are powerful search and optimisation techniques inspired by the mechanisms of natural evolution They imitate on an abstract level biological principles such as a population based approach the inheritance of information the variation of information via crossover mutation and the selection of individuals based on fitness The most well known class of EA are Genetic Algorithms GA which have received much attention not only in the scientific community lately Other variants of EA in particular Genetic Programming Evolution Strategies and Evolutionary Programming are less popular though very powerful too Traditionally most practical applications of EA have appeared in the technical sector Management problems for a long time have been a rather neglected field of EA research This is surprising since the great potential of evolutionary approaches for the business and economics domain was recognised in pioneering publications quite a while ago John Holland for instance in his seminal book *Adaptation in Natural and Artificial Systems* The University of Michigan Press 1975 identified economics as one of the prime targets for a theory of adaptation as formalised in his reproductive plans later called Genetic Algorithms
