High-availability website hosting HAProxy vs Corosync
Thomas Vandeveire, 2019 Zetes het bedrijf onder andere verantwoordelijk voor de productie van identiteitskaarten wilt 2 servers voor de e id middleware repository 1 van deze servers wordt de master server en de andere wordt de backup server Momenteel is er nog maar 1 server dus vanaf dat er zich een probleem voordoet op die server is de e id middleware repository niet meer bereikbaar Door de hogere eisen van de mensen is het de bedoeling van dit onderzoek om de uptime van deze e id middleware repository te verbeteren Momenteel is er nog geen opvangnet voor in het geval dat de hoofdservers faalt of niet meer bereikbaar is Daarom is er in dit onderzoek nagegaan welk high availability systeem dat dit zou kunnen oplossen In dit onderzoek werden er 2 open source cluster systemen vergeleken met elkaar zowel op vlak van prestaties als op vlak van resource gebruik De 2 systemen die vergeleken werden zijn HAProxy en Corosync het vernieuwde LVS In dit document wordt er uitgebreid gekeken naar de reden van dit onderzoek er wordt gekeken naar wat deze systemen nu eigenlijk zijn van waar ze komen en wat ze kunnen Ook worden de basis principes van high availability en load balancing uitgelegd Verder worden ook de tests die geschreven werden voor dit onderzoek bekeken en worden de resultaten besproken Uit het resultaat is gebleken dat Corosync veel beter presteert bij een falen dan HAProxy Corosync is duidelijk stukken sneller bij het omschakelen naar een andere server Corosync heeft dan weer wel een veel hoger RAM gebruik maar een constant en lager CPU gebruik in vergelijking met HAProxy HAProxy heeft wel hoge pieken in het CPU gebruik maar gebruikt dan weer weinig

RAM Corosync is de betere oplossing als het enkel gaat over een high availability systeem want het is sneller en gebruikt minder resources Als er nood is aan een modulair systeem met een veel grotere waaier aan functies dan is HAProxy de betere keuze het is een kleine hoeveelheid trager en gebruikt meer resources maar h

A Network Function Virtualization Based Load Balancer for TCP Jinxuan Wu, 2015 A load balancer is an essential part of many network systems A load balancer is capable of dividing and redistributing incoming network traffic to different back end servers thus improving reliability and performance Existing load balancing solutions can be classified into two categories hardware based or software based Hardware based load balancing systems are hard to manage and force network administrators to scale up replacing with more powerful but expensive hardware when their system can not handle the growing traffic Software based solutions have a limitation when dealing with a single large TCP flow In recent years with the fast developments of virtualization technology a new trend of network function virtualization NFV is being adopted Instead of using proprietary hardware an NFV network infrastructure uses virtual machines running to implement network functions such as load balancers firewalls etc In this thesis a new load balancing system is designed and evaluated This system is high performance and flexible It can fully utilize the bandwidth between a load balancer and back end servers compared to traditional load balancers such as HAProxy The experimental results show that using this NFV load balancer could have n times better performance than HAProxy where n is the number of back end servers Also an extract transform and load ETL application was implemented to demonstrate that this load balancer can shorten data load time The experiment shows that when loading a large data set 18 3GB our load balancer needs only 28 % less time than traditional load balancer
