Loop-mediated Isothermal Amplification (LAMP) - Review and Classification of Methods for Sequence-specific Detection Lisa Becherer, Nadine Borst, Mohammed Bakheit, Sieghard Frischmann, Roland Zengerle, Felix von Stetten, 2020 Abstract In the course of the last 20 years isothermal nucleic acid amplification tests have emerged as an important diagnostic tool not only for clinical applications but also for food quality control and environmental monitoring Loop mediated isothermal amplification LAMP is well known for its robust and highly sensitive and specific amplification of target DNA which is achieved by utilizing up to six primers Moreover LAMP excels through its isothermal and energy efficient amplification requirements rendering it a prime candidate for low cost diagnostics and analysis at the point of need Recently methods for sequence specific detection have gained more importance because unlike sequence independent detection methods they are highly specific towards the target DNA In the last 13 years a variety of sequence specific methods have emerged based on a very diverse range of sensing techniques including optical magnetic piezoelectric electrochemical and magnetoresistive sensing To give structure to the diverse multitude of sequence specific methods we created a systematic classification and provide a critical comparative evaluation according to a catalogue of criteria analytical performance multiplexing quantification and instrumental requirements Fluorescence based detection making up half of the methods can be processed on open platforms and satisfies all the criteria listed before Instrumental requirements are discussed in terms of complexity portability and fluidic cartridges In addition the technological readiness level and the kind of platform open versus method tailored are evaluated the latter playing an important role in the miniaturization and automation of operational process steps We also observe an increase in the use of smartphone integrated sensors to improve LAMP based point of need testing In summary recent developments in methods for the sequence specific detection of LAMP demonstrate high potential for many future applications

Development of Low-cost and Easy-to-use Tools for Multiplex Pathogen Detection Dieter Maurice Tourlousse, 2010 Digital Loop-Mediated Isothermal DNA Amplification Janay Elise Kong, 2017 Nucleic acid amplification has applications in diagnostics sequencing genetic fingerprinting among others Currently nucleic acid amplification is treated as the gold standard method for several diagnostics however because of the multi step protocols and the large equipment these assays are lengthy and require laboratory settings Digital nucleic acid amplifications assays developed have greatly improved

several aspects of nucleic acid amplification by creating a more robust and sensitive assay This is due to the reduction in background noise and the ability to effectively concentrate target analytes in nano or picoliter volumes by compartmentalization of these samples We were able to demonstrate a 69 fold fluorescence change in an isothermal nucleic acid amplification assay with a 60% increase in fluorescence stability with elevated temperatures over the time course of the reaction with the use of a unique dye combination of EvaGreen and hydroxynaphthol blue HNB Due to the improvements in signal we were able to demonstrate comparable results using a mobile phone based fluorescence plate reader as with that of a benchtop reader The unique dye combination was then applied to a digital system demonstrating signal improvements that are crucial to developing a robust assay giving a higher efficiency percentage of on wells closer to the theoretical value and a larger difference in fluorescence intensities for on versus off wells Lastly we examined the mechanism of the dye combination to best determine additional ways of improving the signal generation By sequestering EvaGreen HNB allows amplification to proceed without interference Additionally a Förster resonance energy transfer FRET interaction between the dye molecules when DNA is absent from the solution acts to lower the background fluorescence such that a greater fluorescence fold change occurs with DNA amplification The EvaGreen and HNB have a highly tuned binding affinity such that prior to DNA amplification they have FRET interactions and afterwards in the presence of large amounts of DNA EvaGreen binding to DNA becomes more favorable All of these developed technologies and methods work in conjunction to improve upon currently developed techniques for nucleic acid amplification in point of care settings
