Advances in Construction Materials 2007 Christian U. Grosse, 2007-08-14 This book addresses one of the most important material categories Materials used for constructions A large percentage of the gross national product of most countries goes into infrastructure and buildings This statement is true not only for the present but for most other periods in history and for most cultures This explains why understanding the behavior of construction materials has always been the object of intense investigations The construction industry consumes extreme volumes of material and the growing demand for quality and safety require continuous improvement of materials and material compositions A deep understanding of material behavior is essential to enable efficient construction light weight or heavily burdened structures ask for the development of innovative composites or new material compositions Rapid economic growth and a dense and growing population require sensitive and sustainable use of resources Finally efficient use of resources means extending the usage of existing structures so non destructive testing methods are needed to assess the safety and utility of these structures Civil Engineers and Material Scientists from all over the world are openly discussing ideas for new materials and for structural health monitoring Over the last decade many innovations have come to fruition primarily in the field of composites but also for improving the design of existing material This is especially true for concrete perhaps the most used material in the world broadening its range of applications and improving performance

Connections between Steel and Concrete Rolf Eligehausen, Werner Fuchs, Philipp Grosser, Giovacchino Genesio, 2012-02-27 Anchorage by fasteners and composite structures of steel and concrete have seen dramatic progress in research technology and application over the past decades The understanding of the fundamental principles underlying both disciplines has significantly improved Concurrently there has been rapid growth in

the development of sophisticated new products and the establishment of international directives and codes to ensure their safe and economical use in a wide range of engineered structures. Although they deal with very similar problems, the two disciplines have developed independently from each other. To optimize the use of composite structures and fastenings to concrete, however, it is necessary to have knowledge of both the local behavior of the fastening system and the global behavior of the structure. It became apparent that a forum offering the opportunity to expand and to exchange experience in the field of connecting steel and concrete would benefit all involved. Furthermore, this forum would aid in the rapid dissemination of new ideas, technologies, and solutions, as well as explore new areas of research. This book forms the Proceedings of the 2nd Symposium on Connections between Steel and Concrete. As the 1st Symposium in 2001, it brought together leading experts from all facets of the research, design, construction, and anchor manufacturing community from around the world. Their lectures covered the topics: test methods, behavior, and design; dynamic loading; shock; earthquake; fatigue; durability; exceptional applications; strengthening; and structures related topics. In total, 129 papers are gathered in these 2 volumes.

ACI Structural Journal, 1995 **fib Model Code for Concrete Structures 2010**

fib - federation internationale du beton, 2013-12-04

The International Federation for Structural Concrete (fib) is a pre-normative organization. Pre-normative implies pioneering work in codification. This work has now been realized with the fib Model Code 2010. The objectives of the fib Model Code 2010 are to serve as a basis for future codes for concrete structures and present new developments with regard to concrete structures, structural materials, and new ideas in order to achieve optimum behaviour. The fib Model Code 2010 is now the most comprehensive code on concrete structures, including their complete life cycle: conceptual design, dimensioning, construction, conservation, and dismantlement. It is expected to become an important document for both national and international code committees, practitioners, and researchers. The fib Model Code 2010 was produced during the last ten years through an exceptional effort by Joost Walraven, Convener, Delft University of Technology, The Netherlands; Agnieszka Bigaj van Vliet, Technical Secretary, TNO Built Environment and Geosciences, The Netherlands; as well as experts out of 44 countries from five continents.
