

Dimensioning Tracking Area for LTE Network

Rahul Sharma, Rahul Atri, Preet Kamwar Singh Rekhi, Sukhvinder Singh Malik, Mandeep Singh Arora

Abstract— Mobility management (MM) is one of the main functions in mobile networks. It aims to track the user equipment (UEs) and to allow calls, other mobile phone services to be delivered to UEs. For any mobility protocol there are two separate problems to be solved. One is location management (or sometimes called reachability), which keeps track of the positions of a UE in the mobile network. The other one is handover management (or sometimes called session continuity), which makes it possible for a UE to continue its sessions while moving to another cell and changing its access point. This document focuses on the location management problems. Tracing UEs in a mobile network is the key task in location management. Tracking Area (TA) in LTE is a logical grouping of cells in a network. TA is almost the same concept as the Location Area (LA). In configuring TAs, a key consideration is to minimize the total amount of signaling overhead.

1. INTRODUCTION

Long Term Evolution (LTE) has been designed to support only packet-switched services. It aims to provide seamless Internet Protocol (IP) connectivity between User Equipments (UE) and the packet data network (PDN), without any disruption to the end user's applications during mobility. The term "Long Term Evolution" encompasses the evolution of the Universal Mobile Telecommunications System (UMTS) radio access through the Evolved UTRAN (E-UTRAN).

Figure 1: LTE Architecture and Its Interfaces

It is accompanied by an evolution of the non-radio (Core Network) aspects under the term "System Architecture Evolution" (SAE), which includes the Evolved Packet Core (EPC) network.

At a high level, the network is comprised of the Core Network (EPC) and the access network E-UTRAN. The Core Network consists of many logical nodes. The core network in LTE is called Evolved Packet Core (EPC) which is responsible for the overall control of the UE and establishment of the bearers.

The main logical nodes of the EPC are PDN Gateway (PGW).

Serving Gateway (S-GW), Mobility Management Entity (MME), Home Subscriber Server (HSS), Policy Control and Charging Rules Function (PCRF)

The access network is made up of essentially just one node, the evolved NodeB (eNodeB), through which Connects UE to the network.

Each of these network elements is interconnected by means of interfaces that are standardized in order to allow multi-vendor interoperability. This gives the possibility to source different network elements from different vendors.

II. GUIDELINES FOR DIMENSIONING AND PLANNING TRACKING AREA (TAS)

Dimensioning aims to find a suitable number of eNodeBs to be included in a TA list.

Planning includes determining TA borders and configuring TA lists.

A. Key Terms

The following terms are used in this document:

Blocked page: A blocked page is a page that cannot be transmitted over the air interface at the first valid Paging Occasion (PO) due to lack of resources.

Page: The message sent by the Mobility Management Entity (MME) to the User Equipment (UE) during paging.

Paging: The procedure in which the MME notifies an idle UE about an incoming data connection. The procedure includes sending a paging message over the S1 Application Protocol (S1-AP) and the air interface.

Paging capacity: The average number of pages per second that a node can handle. Paging capacity incorporates various margins to manage conditions like traffic fluctuations.

Paging Frame (PF): The radio frames where UE paging can take place.

Paging load: The fraction of resources required for paging.

Paging Occasion (PO): The sub frames where UE paging can take place. Paging record Pages to different UEs can be multiplexed in the same Radio Resource Control (RRC) paging message. A paging record is the information associated with one of those pages.

B. Tracking Areas, Code and Lists

Tracking Area: A Tracking Area corresponds to the Routing Area (RA) used in

LTE-A Cellular Networks Abid Yahya, 2016-09-02 In this book three different methods are presented to enhance the capacity and coverage area in LTE A cellular networks. The scope involves the evaluation of the effect of the RN location in terms of capacity and the determination of the optimum location of the relay that provides maximum achievable data rate for users with limited interference at the cell boundaries. This book presents a new model to enhance both capacity and coverage area in LTE A cellular network by determining the optimum location for the RN with limited interference. The new model is designed to enhance the capacity of the relay link by employing two antennas in RN. This design enables the relay link to absorb more users at cell edge regions. An algorithm called the Balance Power Algorithm BPA is developed to reduce MR power consumption. The book pertains to postgraduate students and researchers in wireless mobile communications. A Network Dimensioning Tool Dimitris Alevras, Martin Grötschel, Roland Wessäly, 1996

Abstract Designing low cost networks that survive certain failure situations belongs to one of the prime tasks in the telecommunications industry In this paper we describe a mathematical model integrating several aspects of survivability that are elsewhere treated in a hierarchical fashion We present mathematical investigations of this model a cutting plane algorithm as well as several heuristics for its solution Moreover we report computational results with real world data The problem we address is the following Suppose between each pair of nodes in a region a communication demand is given We want to determine the topology of a telecommunication network connecting the given nodes and to dimension all potential physical links For each link the possible capacities are restricted to a given finite set The capacities must be chosen such that the communication demands are satisfied even if certain network components fail and such that the network building costs are as small as possible Moreover for each pair of nodes and each failure situation we want to determine the paths on which the demand between the nodes is routed
