Part 3: Workmanship
Amendment A1 to DIN 1045-3

DIN
1045-3/A1

ICS 91.080.40

Modifies July 2001 edition.

Tragwerke aus Beton, Stahlbeton und Spannbeton – Teil 3: Bauausführung (Änderung A1)

In keeping with current practice in standards published by the International Organization for Standardization (ISO), a comma has been used throughout as the decimal marker.

NOTE: This translation is to be used in conjunction with the translation of DIN 1045-3, July 2001 edition.

Foreword

These amendments to DIN 1045-3 supplement or supersede the specifications of DIN 1045-3. They are the result of practical experience with the standard since its publication.

The German-language version of DIN 1045-3/A1 incorporates the amendments from a Corrigendum to DIN 1045-3 (DIN 1045-3 Ber 1) issued in June 2002, together with new amendments. This English translation indicates the new amendments only. The former are already included in the English translation of DIN 1045-3 and are not repeated here.

Re clause 2 Normative references

The reference to the *DATStb-Richtlinie für Fließbeton* (DATStb Code of practice on flowing concrete) has been deleted.

Re table 2

In the table heading, the values defining the minimum $f_{t,crack}/f_{t,un-crack}$ ratio should be moved two columns to the right.

Re subclause 10.4 Tolerances for structural safety

Item (1) is replaced by the following:

(1) The greater cross-sectional dimension of concrete sections (i.e. the overall thickness of beams or slabs, breadth of beams or webs, and depth of columns) shall be subject to the following tolerances (permitted deviations), Δf :

- | | | |
|----------------------------------|--------------|-----|
| for f not greater than 150 mm: | ± 10 mm; | (1) |
| for f equal to 400 mm: | ± 15 mm; | (2) |
| for f not less than 2500 mm: | ± 30 mm; | (3) |

Intermediate values may be determined by linear interpolation. Δf is usually kept within if tolerances referred to in subclause 10.2 are observed.

Document comprises 2 pages.

The History of the Theory of Structures Karl-Eugen Kurrer, 2012-01-09 This book traces the evolution of theory of structures and strength of materials the development of the geometrical thinking of the Renaissance to become the fundamental engineering science discipline rooted in classical mechanics Starting with the strength experiments of Leonardo da Vinci and Galileo the author examines the emergence of individual structural analysis methods and their formation into theory of structures in the 19th century For the first time a book of this kind outlines the development from classical theory of structures to the structural mechanics and computational mechanics of the 20th century In doing so the author has managed to bring alive the differences between the players with respect to their engineering and scientific profiles and personalities and to create an understanding for the social context Brief insights into common methods of analysis backed up by historical details help the reader gain an understanding of the history of structural mechanics from the standpoint of modern engineering practice A total of 175 brief biographies of important personalities in civil and structural engineering as well as structural mechanics plus an extensive bibliography round off this work

number of outstanding specialists working in the field of shear design who had a chance to exchange their opinions and proposals for improving the current knowledge of shear behaviour in beams and slabs The specialists came from different parts of the world which made the workshop general and representative The workshop was organised by fib Working Party 2 2 1 Shear in Beams convened by O Bayrak which is a part of fib Commission 2 Analysis and Design Individual contributions mainly address shear in beams with low transversal reinforcement It is crucial because many existing structures lack such reinforcement Different theories e g Critical Shear Crack Theory CSCT Modified Compression Field Theory MCFT Multi Action Shear Model MASM etc were presented and compared with procedures used in selected national codes or in the fib Model Code 2010 The models for shear design were often based to a great extent on empirical experience The refined presented models tend to take into account the physical mechanisms in structures more effectively A brittle behaviour in shear requires not only to check the equilibrium and failure load but also to follow the progress of failure including the crack development and propagation stress redistribution etc The significance of the size effect which causes the nominal strength of a large structure to be smaller than that of a small structure was pointed out Nowadays the fibre reinforcement is used more than before since it allows significant labour costs savings in the construction industry The contribution of fibres is suitable for shear transfer It is very convenient that not only ordinary fibre reinforced elements were addressed but also the UHPFRC beams The production of this new material is indeed growing while the development of design recommendations has not been sufficiently fast Fatigue resistance of structures with low shear reinforcement is also an important issue which was also addressed in this bulletin It cannot be neglected in prestressed bridges which are exposed to dynamic loads A comprehensive understanding of the shear behaviour is necessary Although many laboratory experiments are carried out they are suitable only to a limited extent New testing methods are being developed and show promising results e g digital image correlation An actual structure performance should rather be tested on a large scale ideally on real structures under realistic loading conditions ii The papers presented in the bulletin are a basis for the discussion in view of the development of updated design rules for the new fib Model Code MC2020 which is currently under preparation fib Bulletins like this one dealing with shear help to transfer knowledge from research to design practice The authors are convinced that it will lead to better new structures design of as well as to savings and to a safety increase in older existing structures whose future is often decided now
