

12.2 Check the bolts for signs of wear like these. If it looks worn, replace it.

expensive. For a faster charge, you can use a higher amperage charger, but don't use one rated more than 1/10th the amp-hour rating of the battery. Rapid boost charges that claim to restore the power of the battery in less than two hours are based on the battery and can damage batteries not in good condition. The type of charging should only be used in emergency situations.

11. The average time necessary to charge a battery should be listed in the instructions that come with the charger. As a general rule, a motor-charger will charge a battery in 12 to 16 hours.

12. Remove all the cell caps (if equipped) and cover the holes with a clean cloth to prevent splashing electrolyte. Reconnect the negative battery cable and hook the battery charger cable across up to the battery post opposite in position. Negative to negative; then plug in the charger. Make sure it is set at 15 volts if it has a voltage switch.

13. If you're using a charger with a rate higher than two amps, check the battery regularly during charging to make sure it doesn't overheat. If you're using a three-charge, you can safely let the battery charge overnight after you've checked it regularly for the first couple of hours.

14. If the battery has terminals cast into, remove the specific gaskets with a hydraulic steel punch that during the last few hours of the charging cycle. Hydraulics are available independently from auto parts stores. Follow the instructions that come with the hydraulic. For Corbin's battery charger, when there's no change in the specific gravity reading the two hours into the electrolyte in the cells is showing stabilizing freely. The specific gravity reading from each cell should be very close to

the others. If not, the battery probably has a fault inside.

15. Some batteries with sealed tops have built-in hydrometers on the top that indicate the state-of-charge by the color treatment in the hydrometer window. Normally, a light-colored hydrometer indicates a full charge and a dark hydrometer indicates the battery still needs charging.

16. If the battery has a sealed top and no built-in hydrometer, you can hook up a digital voltmeter across the battery terminals to check the charge. A fully charged battery should read 12.7 volts or higher.

17. Further information on the battery and jump-starting can be found in Chapter 3 and in the back of this manual.

12.4a The motor bolt on the motor bolt's terminal must extend between the motor (B) on the terminal mount (B) above, motor bolt.

12.5 Detailed check, adjustment and replacement every 6000 miles or 6 months

Refer to illustrations 12.5, 12.6a, 12.6b, 12.6c, 12.6d, 12.6e

1. A serpentine belt is located at the front of the engine and plays an important role in the overall operation of the engine and its components. Due to its function and material make-up, the belt system is wear and should be periodically inspected. The serpentine belt drives the alternator, power steering pump, water pump and air conditioning compressor. Note: All models have one belt. Information here can mean belt and a second, over-belt just for the air conditioning compressor (if equipped).

2. With the engine off, open the hood and use your fingers (and a flashlight, if necessary) to move along the belt checking for cracks, wear and separation of the belt plies. Also check for fraying and glazing, which gives the belt a shiny appearance (see illustration). Note: wear of the belt should be inspected, which means you will have to bend the belt to check the underside.

3. Check the underside of the belt. They should lie at the same depth, with none of the surface cracked.

4. The tension of the belt is maintained by a spring-loaded tensioner assembly and isn't adjustable. The belt should be replaced when the mark on the movable part of the tensioner moves out of the acceptable range on the stationary part of the tensioner (see illustration).

5. To replace the belt, slide the tensioner to release belt tension (see illustration). Note: Before removing the belt, make a note of how it is routed around the pulleys. If you don't know you can replace it.

6. Remove the belt from the tensioner and routing components are ready to install the tensioner.

12.6a The tensioner for the air conditioning compressor (indicated) is similar to one. The mark (B) on the movable part of the tensioner must be within the acceptable range mark (C).

12.6b Place a tensioner on the tensioner belt (A) and have the tensioner structure (B) for belt removal.

12.6c On V6 models with an air conditioning, the motor belt tensioner is fastened from below. Use a 1/2 inch drive nut in the tensioner's support hole (A) to rotate it (B) for belt removal.

7. Route the new belt over the various pulleys, again noting the tensioner to allow the belt to be installed. Then remove the belt tensioner.

Tensioner replacement

Refer to illustrations 12.6a and 12.6b

1. To replace a tensioner that has lost its spring tension, replace the tensioner with a new one. Before installing, remove the mounting bolts (see illustration).

2. Installation is the reverse of the removal process.

12.6 Underhood hose check and replacement every 6000 miles or 6 months

General

Caution: Replacement of an air conditioning hose that is left in a static position depends on an air conditioning shop that has the

equipment to depressure the system safely and recharge the refrigerant. Never remove an air conditioning component or hose until the system has been depressured.

1. High temperatures in the engine compartment can cause the deterioration of the rubber and plastic hoses used for engine, accessory and emission systems. Cracks, abrasions, fraying and other damage should be noted for cracks, loose clamps, material hardening and leaks. Information specific to the cooling system hoses can be found in Section 14.

2. Some fuel and oil hoses are secured to one thing with clamps. Where clamps are used, check to be sure they haven't loosened or broken, allowing the hose to leak. If clamps aren't used, make sure the hose has not separated under tension when it slips out of the fitting, allowing it to leak.

Vacuum hoses

3. It's quite common for vacuum hoses, especially those in the emission system, to be color-coded or identified by vacuum hoses

marked with lines. Vacuum systems require hoses with different cut-thickness, collapse resistance and temperature resistance. When replacing hoses, be sure the new ones are made of the same material.

4. Often the only effective way to check a hose is to remove it completely from the vehicle. If more than one hose is removed, be sure to label the hoses and fittings to avoid system confusion.

5. When checking vacuum hoses, be sure to include any plastic fittings in the check against the things for cracks and the hose where it fits over the fitting for distortion, which could cause leakage.

6. A good grade of vacuum hose (1/4 inch inside diameter) can be used as a substitute to replace vacuum hoses that are out of the hose in your car and provide enough vacuum hoses and fittings, leaving for the fitting most components of a vacuum hose. **Warning:** When working with the vacuum hose, be sure to use a vacuum hose that is rated for use in the engine compartment and is not used in the engine compartment.
