Alvares,Raymond S. Alger,Anne E. Lipska,Louis H. Inman,STANFORD RESEARCH INST MENLO PARK CA.,NAVAL ORDNANCE LAB WHITE OAK MD.,1971 The object of the research was to develop and test methods which will allow high expansion foam production when the only air available to the foam generating nozzle is contaminated from a combustion environment The significant results of the current work can be briefly summarized as follows 1 High expansion foam will not efficiently form if the inlet air temperature to the foam generator exceeds 212F 2 Water spray scrubbing successfully cools inlet air from 600F to 100F a temperature at which foam is efficiently produced 3 The foam stabilization chemicals all affected increased foam made with smoke contaminated air 4 Scaling considerations indicate that scrubbing systems compatible with existing foam generators are feasible Author **The Destruction of High-Expansion Fire-Fighting Foam by the Components of Fuel Pyrolysis and Combustion** Raymond S. Alger,1971 Combustion and pyrolysis products in the air supply of high expansion foam generators generally inhibit foam production While this phenomenon is well documented the mechanism is not known The purpose of this research was to identify both the foam breaking constituents and the mechanisms Chemical constituents were identified both through literature search and measurements Foam breaking parameters were measured by the quality and quantity of foam generated when combustion products were introduced into a laboratory scale foam generator from the foamability of foam solution containing products by surface tension measurements with product contaminated foam solutions and by product gas diffusion through bubble walls Half of the compounds tested detrimentally affect the production and or stability of Hi X foam In an environment of high smoke concentration it is possible at least on laboratory scale to remove enough foam breaking chemicals by water spray scrubbing techniques so that foam formation will resume Author **Inflatable partitions for high-expansion foam generators** R.S. Conti,1995 **In-mine Study of High-expansion Firefighting Foam** Linda L. Chasko,Ronald S. Conti,R. L. Derick,M. R. Krump,Charles P. Lazzara,2003* A mine fire is one of the most challenging safety issues facing a mine operator and can occur at any location underground The National Institute for Occupational Safety and Health NIOSH and the Twentymile

Coal Mine CO conducted in mine experiments to determine the capability of high expansion foam for addressing underground fires The tests were conducted in sloping entries with high capacity diesel powered foam generators The following results were observed a well designed maintained and properly operated high expansion foam generator can propagate a foam plug hundreds of feet in steep upward sloping 20% multiple entries against a ventilation pressure stoppings and partitions designed to contain the foam plug in upward sloping entries must be substantially constructed and the predicted quantity of foam concentrate can be significantly less than the actual amount used due to foam losses such as bubble breakage on dry surfaces This paper describes the production of high expansion fire fighting foam and discusses the in mine experimental tests and results High Expansion Foam Systems National Fire Protection Association,1970 **The Destruction of High Expansion Fire-Fighting Foam by the Components of Fuel Pyrolysis and Combustion. Part III. Tests of Full Scale Foam Generators Equipped with Scrubbers** Raymond S. Alger,Norman J. Alvares,NAVAL ORDNANCE LAB WHITE OAK MD.,1974 The report involved 1 pilot tests of an intermediate scale scrubber generator unit 2 development of a full scale foam supply for a typical ship s engine room and 3 tests on the scrubber generator system with several types of foam under a variety of fire conditions These full scale tests confirmed the previous laboratory observation that regardless of the chemical countermeasures inlet air above 212F must be cooled before foam can be produced With the degree of cooling and scrubbing achieved in the pilot tests a 50% reduction in foam yield occurred therefore the engine room system was designed with twice the capacity required to achieve the specified fill rate of three feet per minute With this safety factor the system was only marginally successful The design fill rate was readily exceeded for spray fires but only one of the fresh water foams met the requirements for bilge and bilge plus spray fires Either a layer safety factor or improved scrubbing efficiency will be required for the salt water compatible foams Modified author abstract **Standard for High Expansion Foam Systems** National Fire Protection Association.
