Directions: Complete the following problems as specified by each question, and then check your work using the solutions that follow. For extended, step-by-step solutions, access your Student Tools online.

1. Water has a specific heat of $4186 \text{ J/kg}\cdot\text{K}$. How much heat would it take to raise the temperature of 100 g of water from 25°C to 75°C ?
2. To change phase, a sample of a substance requires an amount of heat per unit mass known as the **latent heat** for that transformation. For evaporation, water has a latent heat of 2257 kJ/kg . How much heat is required to evaporate 30 g of water?
3. How much heat is required to completely evaporate 50 g of water at an initial temperature of 50°C ? Refer to the previous two problems for relevant constants.
4. If 3 mol of an atomic gas changes from a state $(0.1 \text{ m}^3, 1.0 \times 10^5 \text{ Pa})$ to $(0.2 \text{ m}^3, 3.0 \times 10^5 \text{ Pa})$ due to some arbitrary process, and absorbs 45 kJ of heat in the process, how much work is done? Is this an example of an engine?

5. Does the gas in the following cycle lose or gain heat?

6. What is the change in internal energy for a sample of molecular hydrogen undergoing the following process? Assume that the hydrogen atoms are connected rigidly.

the modelling itself The book gives an insight into the power of abstractness by applying the same mathematical methods and strategies to solve a variety of different physical problems This book covers a broad range of topics in an advanced yet accessible manner Each chapter is accompanied by a number of solved exercises which render the book convenient for a lecturer and facilitate its use for an independent study The details of mathematical methods are discussed in the appendices which form a substantial portion of the book Waves And Rays In Seismology: Answers To Unasked Questions (Second Edition)

Michael A Slawinski,2018-05-04 In summary Professor Slawinski has written an engaging volume covering an unfamiliar topic in a highly accessible fashion Non specialists will gain a significant appreciation of the unique complexities associated with seismology Contemporary PhysicsThe author dedicates this book to readers who are concerned with finding out the status of concepts statements and hypotheses and with clarifying and rearranging them in a logical order It is thus not intended to teach tools and techniques of the trade but to discuss the foundations on which seismology and in a larger sense the theory of wave propagation in solids is built A key question is why and to what degree can a theory developed for an elastic continuum be used to investigate the propagation of waves in the Earth which is neither a continuum nor fully elastic But the scrutiny of the foundations goes much deeper material symmetry effective tensors equivalent media the influence or rather the lack thereof of gravitational and thermal effects and the rotation of the Earth are discussed ab initio The variational principles of Fermat and Hamilton and their consequences for the propagation of elastic waves causality Noether's theorem and its consequences on conservation of energy and conservation of linear momentum are but a few topics that are investigated in the process to establish seismology as a science and to investigate its relation to subjects like realism and empiricism in natural sciences to the nature of explanations and predictions and to experimental verification and refutation In the second edition new sections figures examples exercises and remarks are added Most importantly however four new appendices of about one hundred pages are included which can serve as a self contained continuum mechanics course on finite elasticity Also they broaden the scope of elasticity theory commonly considered in seismology **National Survey of Secondary Education** United States.
