Statistical Methods for Food Science John A. Bower, 2013-06-21 The recording and analysis of food data are becoming increasingly sophisticated Consequently the food scientist in industry or at study faces the task of using and understanding statistical methods Statistics is often viewed as a difficult subject and is often avoided because of its complexity and a lack of specific application to the requirements of food science This situation is changing there is now much material on multivariate applications for the more advanced reader but a case exists for a univariate approach aimed at the non statistician This second edition of Statistical Methods for Food Science provides a source text on accessible statistical procedures for the food scientist and is aimed at professionals and students in food laboratories where analytical instrumental and sensory data are gathered and require some form of summary and analysis before interpretation It is suitable for the food analyst the sensory scientist and the product developer and others who work in food related disciplines involving consumer survey investigations will also find many sections of use There is an emphasis on a hands on approach and worked examples using computer software packages and the minimum of mathematical formulae are included The book is based on the experience and practice of a scientist engaged for many years in research and teaching of analytical and sensory food science at undergraduate and post graduate level This revised and updated second edition is accompanied by a new companion website giving the reader access to the datasets and Excel spreadsheets featured in the book Check it out now by visiting www.wiley.com/go/bowerstatistical or by scanning the QR code below

Decontamination of Fresh and Minimally Processed Produce Vicente M.

Gómez-López, 2012-02-13 Attempts to provide safer and higher quality fresh and minimally processed produce have given rise to a wide variety of decontamination methods each of which have been extensively researched in recent years. *Decontamination of Fresh and Minimally Processed Produce* is the first book to provide a systematic view of the different types of decontaminants for fresh and minimally processed produce. By describing the different effects (microbiological, sensory, nutritional, and toxicological) of decontamination treatments, a team of internationally respected authors reveals not only the impact of decontaminants on food safety but also on microbial spoilage, vegetable physiology, sensory quality, nutritional and phytochemical content, and shelf life. Regulatory and toxicological issues are also addressed. The book first examines how produce becomes contaminated, the surface characteristics of produce related to bacterial attachment, biofilm formation, and resistance, and sublethal damage and its implications for decontamination. After reviewing how produce is washed and minimally processed, the various decontamination methods are then explored in depth in terms of definition, generation devices, microbial inactivation mechanisms, and effects on food safety. Decontaminants covered include chlorine, electrolyzed oxidizing water, chlorine dioxide, ozone, hydrogen peroxide, peroxyacetic acid, essential oils, and edible films and coatings. Other decontamination methods addressed are biological strategies (bacteriophages, protective cultures, bacteriocins, and quorum sensing) and physical methods (mild heat, continuous UV light, ionizing radiation, and various combinations of these methods through hurdle technology). The book concludes with descriptions of post-decontamination methods related to storage, such as modified atmosphere packaging, the cold chain, and modeling tools for predicting microbial growth and inactivation. The many methods and effects of decontamination are detailed, enabling industry professionals to understand the available state of the art, methods, and select the most suitable approach for their purposes. The book serves as a compendium of information for food researchers and students of pre and postharvest technology, food microbiology, and food technology in general. The structure of the book allows easy comparisons among methods and searching information by microorganism, produce, and quality traits.
