Handbook of Neuropsychology: Language and aphasia François Boller, Rita Sloan Berndt, Jordan Grafman, 2001
Volume 3 in the series Handbook of Neuropsychology covers traditional approaches to the topic as well as new techniques for investigating language disorders. Separate chapters provide detailed treatments of each of the prominent symptoms of aphasia e.g. deficits of speech production and perception of naming repetition comprehension etc. including cognitive and psycholinguistic interpretations. The cognitive disorders that are related to aphasia including memory and attentional impairments limb apraxia and acalculia are discussed in separate chapters. Supplementing these reviews of aphasia research are chapters detailing other approaches to the study of language brain relationships including functional neuroimaging event related potentials direct cortical stimulation and study of split brain patients. Each chapter provides a current review of its topic with extensive references providing invaluable reference material for the researcher and clinician. The Handbook of Adult Language Disorders Argye E. Hillis, 2013-05-13 This distinctive handbook is a key reference for both clinicians and researchers working in the scientific investigation of aphasia. The focus is on how the study of acquired language disorders has contributed to our understanding of normal language and its neural substrates and to the clinical management of language disorders. The handbook is unique in that it reviews studies from the major disciplines in which aphasia research is conducted: cognitive neuropsychology, linguistics, neurology, neuroimaging, and speech language pathology, as they apply to each topic of language. For each language domain such as reading, there is a chapter devoted to theory and models of the language task, a chapter devoted to the neural basis of the language task, focusing on recent neuroimaging studies, and a chapter devoted to clinical diagnosis and treatment of impairments in that domain.

Rehabilitation Peter Gregor, Alan F. Newell, 2004 Communication and Information Technology has been used to support older and disabled people for over thirty years and there have been many successes in this field. Until recently, research has largely concentrated on people with physical or sensory dysfunction; computer technology has been increasingly used to support cognitive activities in able-bodied people, but its use to support people with disabilities has not had much widespread recognition. Yet well-designed C and IT systems have great potential to enhance the quality of life and independence of people with cognitive dysfunction by enabling them to retain a higher level of independence and control over their lives, providing appropriate levels of monitoring and supervision of at-risk people without violating privacy, keeping people intellectually and physically active, and providing communications methods to reduce social isolation. This special issue of *Neuropsychological Rehabilitation* recognises the potential of information technology to provide support for people with cognitive dysfunction, including the use of computers to provide traditional prostheses, albeit within the cognitive domain. The selection of papers in this issue shows that the help and support available can be far more than the artificial replacement of part of the body: the literal definition of prosthesis and can include techniques to provide lifestyle support for people who would not be thought of as requiring prosthetic support.
