Esfandiari, 2018-01-29 Modeling and Analysis of Dynamic Systems Third Edition introduces MATLAB Simulink and Simscape™ and then utilizes them to perform symbolic graphical numerical and simulation tasks Written for senior level courses modules the textbook meticulously covers techniques for modeling a variety of engineering systems methods of response analysis and introductions to mechanical vibration and to basic control systems These features combine to provide students with a thorough knowledge of the mathematical modeling and analysis of dynamic systems The Third Edition now includes Case Studies expanded coverage of system identification and updates to the computational tools included **Theory of Gyroscopic Effects for Rotating Objects** Ryspek Usubamatov, 2022-06-30 This book highlights an analytical solution for the dynamics of axially rotating objects It also presents the theory of gyroscopic effects explaining their physics and using mathematical models of Euler's form for the motion of movable spinning objects to demonstrate these effects The major themes and approaches are represented by the spinning disc and the action of the system of interrelated inertial torques generated by the centrifugal and Coriolis forces as well as the change in the angular momentum The interrelation of inertial torques is based on the dependency of the angular velocities of the motions of the spinning objects around axes by the principle of mechanical energy conservation These kinetically interrelated torques constitute the fundamental principles of the mechanical gyroscope theory that can be used for any rotating objects of different designs like rings cones spheres paraboloids propellers etc Lastly the mathematical models for the gyroscopic effects are validated by practical tests The 2nd edition became necessary due to new development and corrections of mathematical expressions It contains new chapters about the Tasse top inversion and

inversion of the spinning object in an orbital flight and the boomerang aerodynamics
