SiC based Miniaturized Devices Stephen Edward Sadow, Daniel Alquier, Jing Wang, Francesco LaVia, Mariana Fraga, 2020-06-18 MEMS devices are found in many of today's electronic devices and systems from air bag sensors in cars to smart phones embedded systems etc Increasingly the reduction in dimensions has led to nanometer scale devices called NEMS The plethora of applications on the commercial market speaks for itself and especially for the highly precise manufacturing of silicon based MEMS and NEMS While this is a tremendous achievement silicon as a material has some drawbacks mainly in the area of mechanical fatigue and thermal properties Silicon carbide SiC a well known wide bandgap semiconductor whose adoption in commercial products is experiencing exponential growth especially in the power electronics arena While SiC MEMS have been around for decades in this Special Issue we seek to capture both an overview of the devices that have been demonstrated to date as well as bring new technologies and progress in the MEMS processing area to the forefront Thus this Special Issue seeks to showcase research papers short communications and review articles that focus on 1 novel designs fabrication control and modeling of SiC MEMS and NEMS based on all kinds of actuation mechanisms and 2 new developments in applying SiC MEMS and NEMS in consumer electronics optical communications industry medicine agriculture space and defense

Silicon Carbide Ceramics Andrew J. Ruys, 2023-01-22 It has been three decades since the last significant book was published on SiC ceramics other than those books that specifically focus on SiC semiconductors Thirty years has been a long time in the world of SiC ceramics In the early 1990s SiC was still a relatively obscure ceramic even within the materials community prominent only as an industrial abrasive carborundum and a refractory Chapter 7 This has all changed dramatically in the 21st century For example As a semiconductor SiC greatly surpasses silicon in performance especially in high power systems Its market penetration since its launch in 2001 has been exponential Single crystal SiC semiconductors are covered in Chapter 3 Millions of military and paramilitary personnel have globally been protected with lightweight SiC body armour since the late 1990s Body armour is covered in Chapters 4 and 5 SiC is a composite material close to commercialization that makes possible high temperature load bearing applications hitherto only able to be hypothesized from ultra high temperature jet turbine blades to advanced nuclear fuel encapsulation the possibilities are very promising Aerospace applications are covered in Chapter 9 Other key areas that are addressed are blast resistant SiC vehicle vessel armour in Chapter 8 and wear resistant SiC ceramics in Chapter 6 Silicon Carbide Ceramics will be an essential reference resource for academic and industrial researchers and materials scientists and engineers working in ceramic materials for the semiconductor defence aerospace wear resistance and refractory fields Presents an extensive review of the history production and properties of SiC ceramics including their characterization and applications Discusses classical and state of the art sintering technologies for SiC ceramics Focuses on the future of ceramic manufacturing and advanced ceramic additive technologies

Electric Drive System Design for Electric Vehicles Yunqi Zheng, 2025-12-01

Drivers for Future High-Density Power Electronics Applications ,2014 This paper presents the testing results of an all silicon carbide SiC intelligent power module IPM for use in future high density power electronics applications The IPM has high temperature capability and contains both SiC power devices and SiC gate driver integrated circuits ICs The high temperature capability of the SiC gate driver ICs allows for them to be packaged into the power module and be located physically close to the power devices This provides a distinct advantage by reducing the gate driver loop inductance which promotes high frequency operation while also reducing the overall volume of the system through higher levels of integration The power module was tested in a bridgeless boost converter to showcase the performance of the module in a system level application The converter was initially operated with a switching frequency of 200 kHz with a peak output power of approximately 5 kW The efficiency of the converter was then evaluated experimentally and optimized by increasing the

overdrive voltage on the SiC gate driver ICs Overall a peak efficiency of 97.7% was measured at 3.0 kW output The converter's switching frequency was then increased to 500 kHz to prove the high frequency capability of the power module was then pushed to its limits and operated at a switching frequency of 500 kHz With no further optimization of components the converter was able to operate under these conditions and showed a peak efficiency of 95.0% at an output power of 2.1 kW
