Vital Directions for Mathematics Education

Research Keith R Leatham, 2014-07-08 This book provides a collection of chapters from prominent mathematics educators in which they each discuss vital issues in mathematics education and what they see as viable directions research in mathematics education could take to address these issues All of these issues are related to learning and teaching

mathematics The book consists of nine chapters seven from each of seven scholars who participated in an invited lecture series Scholars in Mathematics Education at Brigham Young University and two chapters from two other scholars who are writing reaction papers that look across the first seven chapters The recommendations take the form of broad overarching principles and ideas that cut across the field In this sense this book differs from classical research agenda projects which seek to outline specific research questions that the field should address around a central topic **Linear Systems Theory**

Ben M. Chen,Zongli Lin,Yacov Shamash,2012-12-06 Structural properties play an important role in our understanding of linear systems in the state space representation The structural canonical form representation of linear systems not only reveals the structural properties but also facilitates the design of feedback laws that meet various control objectives In particular it decomposes the system into various subsystems These subsystems along with the interconnections that exist among them clearly show the structural properties of the system The simplicity of the subsystems and their explicit interconnections with each other lead us to a deeper insight into how feedback control would take effect on the system and thus to the explicit construction of feedback laws that meet our design specifications The discovery of structural canonical forms and their applications in feedback design for various performance specifications has been an active area of research for a long time The effectiveness of the structural decomposition approach has also been extensively explored in nonlinear systems and control theory in the recent past The aim of this book is to systematically present various canonical representations of the linear system that explicitly reveal different structural properties of the system and to report on some recent developments on its utilization in system analysis and design **The Balancing Act** Judith L. Klavans,Philip Resnik,1996

Symbolic and statistical approaches to language have historically been at odds the former viewed as difficult to test and therefore perhaps impossible to define and the latter as descriptive but possibly inadequate At the heart of the debate are fundamental questions concerning the nature of language the role of data in building a model or theory and the impact of the competence performance distinction on the field of computational linguistics Currently there is an increasing realization in both camps that the two approaches have something to offer in achieving common goals The eight contributions in this book explore the inevitable balancing act that must take place when symbolic and statistical approaches are brought together including basic choices about what knowledge will be represented symbolically and how it will be obtained what assumptions underlie the statistical model what principles motivate the symbolic model and what the researcher gains by combining approaches The topics covered include an examination of the relationship between traditional linguistics and statistical methods qualitative and quantitative methods of speech translation study and implementation of combined techniques for automatic extraction of terminology comparative analysis of the contributions of linguistic cues to a statistical word grouping system automatic construction of a symbolic parser via statistical techniques combining linguistic with statistical methods in automatic speech understanding exploring the nature of transformation based learning and a hybrid symbolic statistical

approach to recovering from parser failures **Dictionary of Modern American Philosophers** John R. Shook, 2005-01-01
The Dictionary of Modern American Philosophers includes both academic and non academic philosophers and a large number of female and minority thinkers whose work has been neglected. It includes those intellectuals involved in the development of psychology, pedagogy, sociology, anthropology, education, theology, political science and several other fields before these disciplines came to be considered distinct from philosophy in the late nineteenth century. Each entry contains a short biography of the writer, an exposition and analysis of his or her doctrines and ideas, a bibliography of writings and suggestions for further reading. While all the major post Civil War philosophers are represented, the most valuable feature of this dictionary is its coverage of a huge range of less well known writers including hundreds of presently obscure thinkers. In many cases the Dictionary of Modern American Philosophers offers the first scholarly treatment of the life and work of certain writers. This book will be an indispensable reference work for scholars working on almost any aspect of modern American thought.

Intelligent and Evolutionary Systems Mitsuo Gen, Osamu Katai, Bob McKay, Akira Namatame, Ruhul A. Sarker, Byoung-Tak Zhang, 2009-02-18
Artificial evolutionary systems are computer systems inspired by ideas from natural evolution and related phenomena. The field has a long history dating back to the earliest days of computer science but it has only become an established scientific and engineering discipline since the 1990s with packages for the commonest form genetic algorithms now widely available. Researchers in the Asia Pacific region have participated strongly in the development of evolutionary systems with a particular emphasis on the evolution of intelligent solutions to highly complex problems. The Asia Pacific Symposia on Intelligent and Evolutionary Systems have been an important contributor to this growth in impact since 1997 providing an annual forum for exchange and dissemination of ideas. Participants come primarily from East Asia and the Western Pacific but contributions are welcomed from around the World. This volume features a selection of fourteen of the best papers from recent APSIES. They illustrate the breadth of research in the region with applications ranging from business to medicine from network optimization to the promotion of innovation. *Implementing Data Mesh* Jean-Georges Perrin, Eric Broda, 2024-09-04
