Plasticity and Textures W. Gambin,2013-04-17 The classical phenomenological theory of plastically anisotropic materials has passed a long way from the work of von Mises presented in 1928 and the Hill formulation given in 1948 to the latest papers on large elastic plastic deformations of anisotropic metal sheets A characteristic feature of this approach is a linear flow rule and a quadratic yield criterion Mathematical simplicity of the theory is a reason of its numerous applications to the analysis of engineering structures during the onset of plastic deformations However such an approach is not sufficient for description of the metal forming processes when a metal element undergoes very large plastic strains If we take an initially isotropic piece of metal it becomes plastically anisotropic during the forming process and the induced anisotropy progressively increases This fact strongly determines directions of plastic flow and it leads to an unexpected strain localization in sheet elements To explain the above it is necessary to take into account a polycrystalline structure of the metal plastic slips on slip systems of grains crystallographic lattice rotations and at last a formation of textures and their evolution during the whole deformation process In short it is necessary to introduce the plasticity of crystals and polycrystals The polycrystal analysis shows that when the advanced plastic strains take place some privileged crystallographic directions called a crystallographic texture occur in the material The texture formation and evolution are a primary reason for the induced plastic anisotropy in pure metals
