Jarosław Konieczny,Waldemar Łatas,Jerzy Stojek,2023-01-01 Hydraulic power systems are commonly used in heavy industry usually highly energy intensive and are often associated with high power losses Designing a suitable system to allow an early assessment of the wear conditions of components in a hydraulic system e g an axial piston pump can effectively contribute to reducing energy losses during use This paper presents the application of a deep machine learning system to determine the efficiency state of a multi piston positive displacement pump Such pumps are significant in high power hydraulic systems The correct operation of the entire hydraulic system often depends on its proper functioning The wear and tear of individual pump components usually leads to a decrease in the pump s operating pressure and volumetric losses subsequently resulting in a decrease in overall pump efficiency and increases in vibration and pump noise This in turn leads to an increase in energy losses throughout the hydraulic system which releases excess heat Typical failures of the discussed pumps and their causes are described after reviewing current research work using deep machine learning Next the test bench on which the diagnostic experiment was conducted and the selected operating signals that were recorded are described The measured signals were subjected to a time frequency analysis and their features calculated in terms of the time and frequency domains underwent a significance ranking using the minimum redundancy maximum relevance MRMR algorithm The next step was to design a neural network structure to classify the wear state of the pump and to test and evaluate the effectiveness of the network s recognition of the pump s condition The whole study was summarized with conclusions Signals and Systems,2003 **Signals and Systems Using MATLAB** Luis F.
