Modelling and Controlling Hydropower Plants German Ardul Munoz-Hernandez, Sa'ad Petrous Mansoor, Dewi Ieuan Jones, 2012-06-13 Hydroelectric power stations are a major source of electricity around the world understanding their dynamics is crucial to achieving good performance The electrical power generated is normally controlled by individual feedback loops on each unit The reference input to the power loop is the grid frequency deviation from its set point thus structuring an external frequency control loop The book discusses practical and well documented cases of modelling and controlling hydropower stations focused on a pumped storage scheme based in Dinorwig North Wales These accounts are

valuable to specialist control engineers who are working in this industry. In addition, the theoretical treatment of modern and classic controllers will be useful for graduate and final year undergraduate engineering students. This book reviews SISO and MIMO models which cover the linear and nonlinear characteristics of pumped storage hydroelectric power stations. The most important dynamic features are discussed. The verification of these models by hardware in the loop simulation is described. To show how the performance of a pumped storage hydroelectric power station can be improved, classical and modern controllers are applied to simulated models of Dinorwig power plant that include PID, Fuzzy approximation, Feed Forward and Model Based Predictive Control with linear and hybrid prediction models.

Numerical Simulation Model of Run of River Hydropower Plants Veysel Yildiz, 2015. Hydropower is a relatively cheap, reliable, sustainable and renewable source of energy that does not consume natural resources nor produces emissions and toxic waste. In fact, compared to all other energy sources, hydropower is the least expensive and most efficient method for generating electricity with a price competitive to traditional energy sources such as fossil fuels, gas and biomass. Most hydroelectric power that is being generated in the world today comes from large hydroelectric dams that generate electricity by converting the potential energy of falling or running water from human-made reservoirs. These reservoir-fed plants distort significantly the local environment and ecosystem and hence much opposition exists towards their use and construction. Run of the river (RoR) hydroelectric stations are a viable alternative to large-scale plants as they require no reservoir capacity so that the water coming from upstream must be used for generation at that moment or must be allowed to bypass the station. This is a key reason why such RoR plants are often referred to as environmentally friendly or green power. Here we introduce a numerical model called HYdroPoWER or HYPER which simulates the daily power production of a RoR plant in response to a historical record of daily discharge values and design and operation variables. HYPER constitutes the first numerical model that takes into explicit consideration the design flow, penstock diameter, penstock thickness, specific speed, rotational speed, cavitation and suction head in evaluating the technical performance, production cost and profit of a RoR plant. The model simulates both single and parallel turbine systems involving Kaplan, Francis, Pelton and crossflow turbines and combinations thereof. HYPER is coded in MATLAB and includes a built-in evolutionary algorithm that optimizes automatically the design of the hydropower system of the RoR plant for a given record of river flows and objective function maximization of net profit or power production. This algorithm can be called from the main model script and maximizes, among others, the type and number of turbines, their design flow and the penstock diameter. Finally, we introduce a graphical user interface (GUI) of HYPER which simplifies numerical simulation and interpretation of the results. Three different case studies are used to illustrate the power of HYPER. The model and its different components are available upon request from the authors.

Modeling and Dynamic Behaviour of Hydropower Plants Nand Kishor, Jesus Fraile-Ardunuy, 2017-03-08. This book presents a systematic approach to mathematical modeling of different configurations of hydropower plants over four sections: modeling and simulation approaches, control of hydropower

plants operation and scheduling of hydropower plants including pumped storage and special features of small hydropower plants

Hydro-Electric Turbines Simulation and Optimization Joseph Nowarski, 2017-01-27 This work introduces hydroelectric power plant optimization method The paper also includes some background information used for preparation of Hydro Electric Energy On line Calculator as on site <http://www.geocities.ws/nowarski/calculators/Hydro.html> The calculator is for general information only it does not include many components and must not be used for actual design economic evaluation or decisions regarding any real project In addition the calculator applies Francis turbine efficiency curve formula which is specific for this work and for the calculator and cannot be used for other turbines The calculator is applied in this work for simulation of the hydroelectric power plant electricity export and for optimization of turbine size Estimation of amount of electricity which will be generated and exported from hydroelectric plant is the most important step in decision taking process regarding the hydro project The amount of electricity exported from the hydroelectric plant will be much lower than the nominal power of the turbine considering 24 hours a day and 365 days a year The optimization using this online calculator allows determination of optimum turbine size for various patterns of the available water flow The optimization includes energy and economic considerations From the energy point of view the aim of the optimization is to find the turbine power which results in highest net electricity export From the economic point of view the aim of the optimization is to find the turbine power that results in highest net income Application of the calculator for simulation and optimization can significantly save investment cost of the project and increase net profit
