ABSTRACT

We imaged sandstone cores at residual gas saturation (S_{gr}) with synchrotron radiation at a nominal resolution of $(19 \mu\text{m})^3$. We studied two three-phase flooding sequences: (1) gas injection into a core containing oil and initial water followed by a waterflood (gw process); (2) gas injection into a waterflooded core followed by another waterflood (wgw process). In the gw flood we measured a significantly higher S_{gr} ($\approx 20.4\%$; S_{gr} in the wgw flood was 5.3%) and a significantly lower residual oil saturation (S_{or} ; S_{or} in the gw flood was 21.4% and S_{or} in the wgw flood was 29.3%). We also studied the size distribution of individual trapped clusters in the pore space. We found an approximately power-law distribution $N \propto r^{-\tau}$ with an exponent $\tau = 2.02$ – 2.03 for the residual oil clusters and $\tau = 2.04$ for the gas clusters in the gw flood. τ (≈ 2.32) estimated for the gas clusters in the wgw process was significantly different. Furthermore, we calculated the surface area A –volume V relationships for the clusters. Again an approximate power-law relationship was observed, $A \propto V^p$ with $p = 0.75$. Moreover, in the gw flood sequence we identified oil layers sandwiched between the gas and water phases; we did not identify such oil layers in the wgw flood. These results have several important implications for oil recovery, carbon geo-sequestration and contaminant transport: (a) significantly more oil can be produced and much more gas can be stored using a gw flood; (b) cluster size distributions for residual oil or gas clusters in three-phase flow are similar to those observed in analogue two-phase flow; (c) there is a large cluster surface area available for dissolution of the residual phase into an aqueous phase; however, this surface area is significantly smaller than predicted by percolation theory ($p = 1$) which implies that CO_2 dissolution trapping and contamination of aquifers by hazardous organic solvents is slower than expected because of reduced interfacial contact areas.

Imperial College Lectures In Petroleum Engineering, The - Volume 2: Reservoir Engineering Martin Blunt, 2017-03-24

This book covers the fundamentals of reservoir engineering in the recovery of hydrocarbons from underground reservoirs. It provides a comprehensive introduction to the topic including discussion of recovery processes, material balance, fluid properties, and fluid flow. It also contains details of multiphase flow including pore scale displacement processes and their impact on relative permeability, with a presentation of analytical solutions to multiphase flow equations. Created specifically to aid students through undergraduate and graduate courses, this book also includes exercises with worked solutions and examples of previous exam papers for further guidance and practice. As part of the Imperial College Lectures in Petroleum Engineering and based on a lecture series on the same topic, Reservoir Engineering provides the introductory information needed for students of the earth sciences, petroleum engineering, and geoscience.

Chemical Enhanced Oil Recovery (cEOR) Laura Romero-Zerón, 2016-10-19 Commercial application of chemical enhanced oil recovery (cEOR) processes is expected to grow significantly over the next decade. Thus, Chemical Enhanced Oil Recovery (cEOR) A Practical Overview offers key knowledge and understanding of cEOR processes using an evidence-based approach intended for a broad audience ranging from field operators and researchers to reservoir engineers dealing with the development and planning of cEOR field applications. This book is structured into three sections: the first section surveys overall EOR processes; the second section focuses on cEOR processes; while the final section describes the electrorheology technology. These sections are presented using a practical and realistic approach tailored for readers looking to improve their knowledge and understanding of cEOR processes in a nutshell.

Development of Unconventional Reservoirs Reza Rezaee, 2020-04-16 The need for energy is increasing, but the production from conventional reservoirs is declining quickly. This requires an economically and technically feasible source of energy for the coming years. Among some alternative future energy solutions, the most reasonable source is from unconventional reservoirs. As the name unconventional implies, different and challenging approaches are required to characterize and develop these resources. This Special Issue covers some of the technical challenges for developing unconventional energy sources from shale gas, oil, tight gas, sand, and coalbed methane.
