Methodologies For The Conception, Design And Application Of Soft Computing - Proceedings Of The 5th International Conference On Soft Computing And Information/intelligent Systems (In 2 Volumes) Gen Matsumoto,Takeshi

Yamakawa,1998-08-25 Soft computing is the common name for a certain form of natural information processing that has its original form in biology especially in the function of human brain It is a discipline rooted in a group of technologies such as fuzzy logic neural networks chaos genetic algorithms probabilistic reasoning and learning algorithms Today soft computing has become an acknowledged concept however for a long time such components of soft computing have been debated and individually developed Since its beginning in 1990 the series of IIZUKA conferences has covered various kinds of technologies that constitute soft computing This series has played a pioneering role in promoting the development of a symbiotic relationship between the various technologies of soft computing At IIZUKA 98 the 5th International Conference on Soft Computing and Information Intelligent Systems new developments and results in this field were introduced and discussed by researchers from academic governmental and industrial institutions around the world This volume presents the opening lecture by Prof Walter J Freeman the keynote speech by Dr Gen Matsumoto the plenary lectures by 5 eminent researchers and about 230 carefully selected papers drawn from more than 25 countries It documents current research and in depth studies on the fundamental aspects of soft computing and their practical applications *Assembly Line* Waldemar Grzechca,2011-08-17 An assembly line is a manufacturing process in which parts are added to a product in a sequential

manner using optimally planned logistics to create a finished product in the fastest possible way It is a flow oriented production system where the productive units performing the operations referred to as stations are aligned in a serial manner The present edited book is a collection of 12 chapters written by experts and well known professionals of the field The volume is organized in three parts according to the last research works in assembly line subject The first part of the book is devoted to the assembly line balancing problem It includes chapters dealing with different problems of ALBP In the second part of the book some optimization problems in assembly line structure are considered In many situations there are several contradictory goals that have to be satisfied simultaneously The third part of the book deals with testing problems in assembly line This section gives an overview on new trends techniques and methodologies for testing the quality of a product at the end of the assembling line

Hybrid Intelligent Engineering Systems L. C. Jain,R. K. Jain,1997 This book on hybrid intelligent engineering systems is unique in the sense that it presents the integration of expert systems neural networks fuzzy systems genetic algorithms and chaos engineering It shows that these new techniques enhance the capabilities of one another A number of hybrid systems for solving engineering problems are presented

The ... IEEE International Conference on Fuzzy Systems Proceedings ,1998

Computational Intelligence in Software Engineering Witold Pedrycz,James F. Peters,1998 This unique volume is the first publication on software engineering and computational intelligence CI viewed as a synergistic interplay of neurocomputing granular computation including fuzzy sets and rough sets and evolutionary methods It presents a unified view of CI in the context of software engineering The book addresses a number of crucial issues what is CI what role does it play in software development how are CI elements built into successive phases of the software life cycle and what is the role played by CI in quantifying fundamental features of software artifacts With contributions from leading researchers and practitioners the book provides the reader with a wealth of new concepts and approaches complete algorithms in depth case studies and thought provoking exercises The topics coverage include neurocomputing granular as well as evolutionary computing object oriented analysis and design in software engineering There is also an extensive bibliography

Automatic Generation of Neural Network Architecture Using Evolutionary Computation E. Vonk,L. C. Jain,Ray P. Johnson,1997 This book describes the application of evolutionary computation in the automatic generation of a neural network architecture The architecture has a significant influence on the performance of the neural network It is the usual practice to use trial and error to find a suitable neural network architecture for a given problem The process of trial and error is not only time consuming but may not generate an optimal network The use of evolutionary computation is a step towards automation in neural network architecture generation An overview of the field of evolutionary computation is presented together with the biological background from which the field was inspired The most commonly used approaches to a mathematical foundation of the field of genetic algorithms are given as well as an overview of the hybridization between evolutionary computation and

neural networks Experiments on the implementation of automatic neural network generation using genetic programming and one using genetic algorithms are described and the efficacy of genetic algorithms as a learning algorithm for a feedforward neural network is also investigated

Uncertain Labeling Graphs and Uncertain Graph Classes (with Survey for Various Uncertain Sets) Takaaki Fujita, Florentin Smarandache, Graph theory a branch of mathematics studies the relationships between entities using vertices and edges Uncertain Graph Theory has emerged within this field to model the uncertainties present in real world networks Graph labeling involves assigning labels typically integers to the vertices or edges of a graph according to specific rules or constraints This paper introduces the concept of the Turiyam Neutrosophic Labeling Graph which extends the traditional graph framework by incorporating four membership values truth indeterminacy falsity and a liberal state at each vertex and edge This approach enables a more nuanced representation of complex relationships Additionally we discuss the Single Valued Pentapartitioned Neutrosophic Labeling Graph The paper also examines the relationships between these novel graph concepts and other established types of graphs In the Future Directions section we propose several new classes of Uncertain Graphs and Labeling Graphs And the appendix of this paper details the findings from an investigation into set concepts within Uncertain Theory These set concepts have inspired numerous proposals and studies by various researchers driven by their applications mathematical properties and research interests
