1. Table capacities are in tons of refrigeration.

 Δp = pressure drop from line friction, psi per 100 ft of equivalent line length Δt = corresponding change in saturation temperature, $^{\circ}\text{F}$ per 100 ft2. Line capacity for other saturation temperatures Δt and equivalent lengths L_e

$$\text{Line capacity} = \text{Table capacity} \left(\frac{\text{Table } L_e}{\text{Actual } L_e} \right)^{0.55} \left(\frac{\text{Actual } \Delta t}{\text{Table } \Delta t} \right)^{1.15}$$

3. Saturation temperature Δt for other capacities and equivalent lengths L_e

*Sizing shown is recommended where any gas generated in receiver must return up condenser line to condenser without restricting condenser flow. Water-cooled condensers, where receiver ambient temperature may be higher than refrigerant condensing temperature, fall into this category.

4. Values based on 105 $^{\circ}\text{F}$ condensing temperature. Multiply table capacities by the following factors for other condensing temperatures.

Condensing Temperature, $^{\circ}\text{F}$	Suction Line	Discharge Line
80	1.11	0.79
90	1.07	0.88
100	1.03	0.95
110	0.97	1.04
120	0.90	1.10
130	0.86	1.18
140	0.80	1.26

*Line pressure drop Δp is conservative; if subcooling is substantial or line is short, a smaller size line may be used. Applications with very little subcooling on very long lines may require a larger line.

Ashrae Chapter 26:

Ventilation and Infiltration American Society of Heating, Refrigerating and Air-Conditioning Engineers, 2001

Handbook of Climate Change Mitigation and Adaptation Maximilian Lackner, Baharak Sajjadi, Wei-Yin Chen, 2025-09-26

Now in its 4th extended edition this completely revised and significantly expanded handbook addresses important new research findings and the global need for action related to climate change in its two most relevant aspects mitigation and adaptation. There is a growing consensus that anthropogenic activities have been driving global climate change and the consequence will be catastrophic for civilization. Reducing the 37.1 billion metric tons of CO₂ produced annually 2017 global emissions along with other greenhouse gases particularly methane has become a leading grand challenge and the pursuit of sustainable energy environments and economies is a complex issue affecting the daily life of every citizen. In this 4th edition readers will find new chapters covering the causes and impacts of global warming, the climate change impacts on health, biodiversity and the economy and emerging technologies for climate change mitigation. Particular attention is given to topics such as wildfire threats, ocean acidification, coral bleaching, sea level rise and permafrost thaw. The latest research on sustainable aviation fuels, carbon mineralization and smart cities is also covered in this new edition as well as topics like sustainable building design, climate resistant building materials and sustainable agriculture. The Handbook of Climate Change Mitigation and Adaptation collates information in this multi-disciplinary area providing readers with a comprehensive overview of the scientific background and current and emerging technologies. Intended for an interdisciplinary global audience of researchers and decision makers at universities and in industry it covers climate change models, established mature and promising future technologies and ideas, the impact of climate change strategies for dealing with global warming, the related political frameworks and climate education.

Building Ventilation Mat Santamouris, Peter

Wouters, 2006-06-01 Ensuring optimum ventilation performance is a vital part of building design. Prepared by recognized experts from Europe and the US and published in association with the International Energy Agency's Air Infiltration and Ventilation Centre AIVC, this authoritative work provides organized, classified and evaluated information on advances in the key areas of building ventilation relevant to all building types. Complexities in airflow behaviour, climatic influences, occupancy patterns and pollutant emission characteristics make selecting the most appropriate ventilation strategy especially difficult. Recognizing such complexities the editors bring together expertise on each key issue. From components to computer tools, this book offers detailed coverage on design, analysis and performance and is an important and comprehensive publication in this field. Building Ventilation will be an invaluable reference for professionals in the building services industry, architects, researchers, including postgraduate students studying building service engineering and HVAC and anyone with a role in energy efficient building design.
