

The aim, though not entirely novel, is commendable, and many topics are well treated. Nevertheless I cannot recommend this book. My overall impression is that the manuscript was too hurriedly produced, and would have been much improved by the ruthlessly critical comments of a colleague not too closely connected with the course on which it was based. There is far too much evidence of a lack of that attention to matters of detail which a purchaser has the right to expect in what is, essentially, an introduction to the standard theory of measure and integration.

Foundations of optimum experimental design, by Andrej Pázman. Pp 228. £30.50. 1986. ISBN 90-277-1865-2 (Reidel)

This book is in a series, 'Mathematics and its applications (East European Series)', and has a Czech author. The translation into English is generally good. It is largely an exploration of the general regression model with uncorrelated observations, considering a variety of optimality criteria. Although it is intended to be a 'starting point for further research' and also a 'textbook for students of statistics' (Preface to the English edition), it is by no means elementary, using amongst other delights linear functionals, Hilbert spaces, uniform ordering of designs, convex hulls.

Only the introductory chapter is likely to interest any but the specialist. It contains an interesting example indicating that good weighing strategies (with a balance) may be unexpected ones. Even this chapter though in parts has to rely heavily on references back from later chapters. The title of Chapter II (of seven) is 'The regression model and methods of estimation', but soon plunges into metric spaces and linear spaces of functions defined on such, etc. Generally in the book there is much advanced linear algebra and analysis. In short—a book only for those who have already reached a high level of sophistication mathematically.

The art of decision-making, by Morton Davis. Pp 92. DM 58. 1986. ISBN 3-540-96228-X (Springer)

Morton Davis is a member of the Department of Mathematics of City College, New York. By analysing decisions to be made (by his compatriots) in finance, industry, management and games, he argues that intuition and common sense are unreliable aids. He poses a variety of problems and indicates appropriate techniques for their solution; he finds mathematical diagrams, algebra, differential calculus and probability particularly helpful and suggests books for further reading.

The reader is expected to have a knowledge of basic (American) high school mathematics and to be ambitious for wealth and success. The able A-level student may not share such ambitions but should find this slim volume an enjoyable addition to his reading list and the problems challenging.

This book would make a splendid text book for a General Studies course on decision making.

conditions have their background in the optimal experiment design theory for regression functions and in simple but useful results on the dependence of eigenvalues of partial differential operators on their parameters. Examples are provided that reveal sometimes intriguing geometry of spatiotemporal input signals and responses to them. An introduction to optimal experimental design for parameter estimation of regression functions is provided. The emphasis is on functions having a tensor product Kronecker structure that is compatible with eigenfunctions of many partial differential operators. New optimality conditions in the time domain and computational algorithms are derived for D optimal input signals when parameters of ordinary differential equations are estimated. They are used as building blocks for constructing D optimal spatio temporal inputs for systems described by linear partial differential equations of the parabolic and hyperbolic types with constant parameters. Optimality conditions for spatially distributed signals are also obtained for equations of elliptic type in those cases where their eigenfunctions do not depend on unknown constant parameters. These conditions and the resulting algorithms are interesting in their own right and moreover they are second building blocks for optimality of spatio temporal signals. A discussion of the generalizability and possible applications of the results obtained is presented. **Optimum**

Designs for Multi-Factor Models Rainer Schwabe, 2012-12-06 In real applications most experimental situations are influenced by a large number of different factors. In these settings the design of an experiment leads to challenging optimization problems even if the underlying relationship can be described by a linear model. Based on recent research this book introduces the theory of optimum designs for complex models and develops general methods of reduction to marginal problems for large classes of models with relevant interaction structures. Ludmila Kubáčková, 1992 **Optimal Observation for Cyber-physical Systems** Zhen Song, YangQuan Chen, Chellury R. Sastry, Nazif C. Tas, 2009-06-30 Optimal Observation for Cyber physical Systems addresses the challenge fundamental to the design of wireless sensor networks. WSNs presented by the obligatory trade off between precise estimates and system constraints. A unified theoretical framework based on the well established theory of optimal experimental design and providing consistent solutions to problems hitherto requiring a variety of approaches is put forward to solve a large class of optimal observation problems. The Fisher information matrix plays a key role in this framework and makes it feasible to provide analytical solutions to some complex and important questions which could not be answered in the past. Readers with an applied background in WSN implementation will find all the understanding of the key theory of optimal experimental design they need within this book. The use of multiple examples to illustrate the theoretical parts of the book brings the subject into sharper focus than would an abstract theoretical disquisition. **Robust Planning and Analysis of**

Experiments Christine H. Mueller, 2012-12-06 Author approved bcc Robust statistics and the design of experiments are two of the fastest growing fields in contemporary statistics. Up to now there has been very little overlap between these fields. In robust statistics robust alternatives to the nonrobust least squares estimator have been developed while in experimental

design designs for the efficient use of the least square estimator have been developed This volume is the first to link these two areas by studying the influence of the design on the efficiency and robustness of robust estimators and tests It shows that robust statistical procedures profit by an appropriate choice of the design and that efficient designs for a robust statistical analysis are more applicable The classical approaches of experimental design and robust statistics are introduced before the areas are linked Dr Christine H M ller teaches at the Department of Mathematics and Computer Science of the Free University of Berlin and is a member of the research project on Efficient Experiments in Industrial Production From 1988 1991 she worked as a biometrician at the Medical Department of the Free University of Berlin
