

Lorentz Dispersion Model

Spectroscopic ellipsometry (SE) is a technique based on the measurement of the relative phase change of reflected and polarized light in order to characterize thin film optical functions and other properties. The measured data are used to describe a model where each layer refers to a given material. The model uses mathematical relations called dispersion formulas that help to evaluate the thickness and optical properties of the material by adjusting specific fit parameters. This application note deals with the Lorentzian dispersion formula.

Note that the technical notes «Classical dispersion models» and «Drude dispersion models» are complementary to this one.

Theoretical model

The Lorentz Dispersion theory [1870] is based on the classical theory of interaction between light and matter and is used to describe frequency-dependent polarization due to bound charges. The binding between electrons and nucleus are considered to be similar to the that of a mass-spring system.

Fig. 1 Binding force between the polarization and the external electric field [1].

Electrons react to an electric-magnetic field by vibrating like damped harmonic oscillators. The way the electric medium to a fluctuating electric field is given by the following equation of motion of a bound electron:

$$m \frac{d^2x}{dt^2} + m \gamma \frac{dx}{dt} + m \omega_0^2 x = -e E_{\text{ext}} \quad (1)$$

where:

- m or m_0 is the electron mass;
- γ or γ_0 is the viscous force, E_0 is the electric field.

- $m_0 \omega_0^2$ is the elastic force, ω_0 is the resonant frequency of the oscillator;
- $-e E_{\text{ext}}$ is the total electric field driving force, e is the magnitude of the electronic charge and E_{ext} is the total electric field acting on the electron. The assumption is made that the electromagnetic and total electric fields are equal and only in form of ω^2 .

The solution to the previous equation yields the expression for the magnitude of oscillation x depending on the photon energy ω :

$$x(\omega) = \frac{1}{m} \frac{E_{\text{ext}}}{\omega_0^2 - \omega^2 + i \gamma \omega} \quad (2)$$

Fig. 2 The electron oscillation and function of frequency [2].

At low frequencies $\omega < \omega_0$, the amplitude x has a maximum value and is in phase with E . At the resonance frequency $\omega = \omega_0$, the amplitude is imaginary and maximum when dissipation is maximum. After $\omega > \omega_0$, there is a 90° phase shift between E and x .

At high frequencies $\omega > \omega_0$, the amplitude x vanishes.

Gems have been used in the manufacture of jewellery and as ornaments since antiquity Considering gems recent statistics have shown that about 15 billion Euros are annually at stake Nowadays gemmology i e the study of gem materials is one of the most expanding fields in the earth sciences positioned between academia and industry As an applied science in gemmology the instruments used should be non or microdestructive and their cost should be reasonable both in terms of equipment and time consumption Gemmology can also be used contribute to the development of pure science and in some cases destructive techniques may have to be used Taking into account the fact that gems are albeit rarely available for scientific research this compilation of 20 articles by around 100 researchers from over 30 different institutions situated in 20 countries from around the globe presented in the Special Issue entitled Mineralogy and Geochemistry of Gems offers very good examples on the application of various methods for their study which will hopefully contribute to our better understanding of gem formation in general and will enhance scientific debates attracting more scientists from various disciplines to get involved in this field *Porous Silicon for Biomedical Applications* Helder A.
