Model-Driven Online Capacity Management for Component-Based Software Systems André van Hoorn, 2014-10-15

Capacity management is a core activity when designing and operating distributed software systems. Particularly enterprise application systems are exposed to highly varying workloads. Employing static capacity management this leads to unnecessarily high total cost of ownership due to poor resource usage efficiency. This thesis introduces a model driven online capacity management approach for distributed component based software systems called SLastic. The core contributions of this approach are a modeling language to capture relevant architectural information about a controlled software system, an architecture based online capacity management framework based on the common MAPE-K control loop architecture, and model driven techniques supporting the automation of the architectural runtime reconfiguration operations for controlling a system's capacity as well as an integration of the Palladio Component Model. A qualitative and quantitative evaluation of the approach is performed by case studies, lab experiments, and simulation.

Software Engineering: Effective Teaching and Learning Approaches and Practices Ellis, Heidi J.C., Demurjian, Steven A., Naveda, J.

Fernando, 2008-10-31 Over the past decade software engineering has developed into a highly respected field. Though computing and software engineering education continues to emerge as a prominent interest area of study, few books specifically focus on software engineering education itself. *Software Engineering: Effective Teaching and Learning Approaches and Practices* presents the latest developments in software engineering education, drawing contributions from over 20 software engineering educators from around the globe. Encompassing areas such as student assessment and learning, innovative teaching methods, and educational technology, this much needed book greatly enhances libraries with its unique research content.

Digital Transformation Reimund Neugebauer, 2019-05-14 With the exception of written letters and personal conversations, digital technology forms the basis of nearly every means of communication and information that we use today. It is also used to control the essential elements of economic, scientific, and public and private life: security, production, mobility, media, and healthcare. Without exaggerating, it is possible to say that digital technology has become one of the foundations of our technologically oriented civilization. The benefits of modern data technology are so impressive and the potential for future applications so enormous that we cannot fail to promote its development if we are to retain our leading role in the competitive international marketplace. In this process, security plays a vital role in each of the areas of application of digital technology: the more technological sectors are entrusted to data systems technology, the more important their reliability becomes to us. Developing digital systems further while simultaneously ensuring that they always act and respond in the best interests of people is a central goal of the technological research and development propagated and conducted by Fraunhofer.
