Industrial Engineering in the Digital Disruption Era Fethi Calisir, Orhan Korhan, 2020-03-16 This book gathers extended versions of the best papers presented at the Global Joint Conference on Industrial Engineering and Its Application Areas GJCIE held on September 2 3 2019 in Gazimagusa North Cyprus Turkey It covers a wide range of topics including decision analysis supply chain management systems modelling and quality control Further special emphasis is placed on the state of the art and the challenges of digital disruption as well as effective strategies that can be used to change organizational structures and eliminate the barriers that are keeping industries from taking full advantage of today's digital technologies **The Glass Industry**, 1982 *Lean Production Planning and Control in Semi-process Industries* Joaquim Fernàndez Clotet, 2014 Process Industries have traditionally been lumped together on the basis of producing non discrete products However some of these industries are hybrid of process sector as at some point of their production process the products are discretized and treated as discrete units This hybrid manufacturing environments can be classified as another type of manufacturing industries under the name of semi process industries The notion of the discretization point which reflects this hybridity was firstly introduced by Abdulmalek Rajgopal and Needy 2006 and later highlighted by Pool Wijngaard and Van der Zee 2011 Production planning and control environments are defined by the interaction of the customer demand production process and product produced Although they are not totally dependent one from each other these three elements are closely related This dependency was already reflected in the traditional product process matrix from Hayes and Wheelwright 1984 but the matrix captured an overall dependency without analysing in a more granular way This matrix has been expanded and gained detail with the research of current classification for production planning and control and process manufacturing environments With this information manufacturing environments for semi process

industries have been studied and characterised. Lately manufacturing environments have been focusing their efforts on reaching levels of optimisation. Moreover, reducing waste on every one of their production steps and making their processes more flexible in order to accommodate wider demand variation and order fulfilment. Therefore, lean manufacturing methodologies have been implemented in manufacturing industries in order to reach these goals. Production planning and control tools, PPC tools, are between all these lean concepts a small portion which can have reliable profits. Applicability in discrete sectors has been widely demonstrated. Bokhorst Liker 2004. On the other hand, applicability of lean methodologies on process sectors still remains behind due to the rigid properties of these sectors, i.e. inflexible equipment, long set up and changeover times. Therefore, applying this manufacturing concepts and tools in semi process environments can have an easier implementation. Scholars as Abdulmalek et al 2006, Lyons, Vidamour, Jain and Sutherland 2013 among others have been studying and applying these concepts so far. At this thesis, five traditional lean PPC tools are identified and studied to be applied in semi process industries, this being reflected at the product process matrix. The tools analysed are Kanban, pull production, Heijunka, Cyclic wheel planning, Takt time and Cellular manufacturing. From all these tools, cyclic planning methodologies, which include Heijunka and cyclic wheels, between others, have been found the most effective lean PPC tool due to the high capacity of adaptation to different process and product profiles. To apply these tools, not only the process characteristics but also the product demand segmentation in terms of runners, repeaters, strangers is important. That is because each product portfolio requires a different planning and replenishment approach.

Computer-Aided Design and Manufacturing U. Rembold, R. Dillmann, 2012-12-06. Manufacturing contributes to over 60 % of the gross national product of the highly industrialized nations of Europe. The advances in mechanization and automation in manufacturing of international competitors are seriously challenging the market position of the European countries in different areas. Thus it becomes necessary to increase significantly the productivity of European industry. This has prompted many governments to support the development of new automation resources. Good engineers are also needed to develop the required automation tools and to apply these to manufacturing. It is the purpose of this book to discuss new research results in manufacturing with engineers who face the challenge of building tomorrow's factories. Early automation efforts were centered around mechanical gear and cam technology and hardwired electrical control circuits. Because of the decreasing life cycle of most new products and the enormous model diversification, factories cannot be automated efficiently any more by these conventional technologies. With the digital computer, its fast calculation speed and large memory capacity, a new tool was created which can substantially improve the productivity of manufacturing processes. The computer can directly control production and quality assurance functions and adapt itself quickly to changing customer orders and new products.
