

AIRCRAFT STRUCTURE AND DESIGN

AIRCRAFT DESIGN

PHASES OF AIRCRAFT DESIGN

1. **Conceptual Design**
 - The basic questions of configuration, arrangement, size and weight, and performance are answered
2. **Preliminary Design**
 - Begins when the major changes are over
3. **Detail Design**
 - Begins in which the actual pieces to be fabricated are designed

Lofting

- Mathematical modeling of the outside skin of the aircraft with sufficient accuracy to ensure proper fit between its different parts designed by different designers

PRELIMINARY WEIGHT ESTIMATE

- Structural Weight is between 30 to 35% of the total weight

Design Take-off Gross Weight

- Total Weight of the aircraft as it begins the mission for which it was designed

$$W_0 = W_{crew} + W_{payload} + W_{fuel} + W_{empty}$$

Mission Fuel

- Part of the fuel supply that is available for performing the mission

Trapped Fuel

- Fuel which cannot be pumped out of the tanks

Weapon Drop

- The firing of gun and missiles, and is often left out of the sizing analysis

Specific Fuel Consumption

- Rate of fuel consumption divided by the thrust

Lift-to-Drag Ratio

- A measure of the design's overall aerodynamic efficiency

WING DESIGN CONSIDERATIONS

AIRFOIL GEOMETRY

Camber

- Curvature characteristics of most airfoil

Mean Camber Line

- Line equidistant from the upper and lower surfaces

Airfoil Thickness Ratio

- Maximum thickness of the airfoil divided by its chord

$$\text{Thickness Ratio} = \frac{t}{c}$$

Aerodynamic Center

- Point about which the pitching moment remains constant for any angle of attack

ICAF 2019 - Structural Integrity in the Age of Additive Manufacturing Antoni Niepokolczycki,Jerzy Komorowski,2019-07-03 This book gathers papers presented at the 36th conference and 30th Symposium of the International Committee on Aeronautical Fatigue and Structural integrity Focusing on the main theme of Structural Integrity in the Age of Additive Manufacturing the chapters cover different aspects concerning research developments and challenges in this field offering a timely reference guide to designers regulators manufacturer and both researchers and professionals of the broad aerospace community Virtual Principles in Aircraft Structures M. Gatewood,2012-12-06 The basic partial differential equations for the stresses and displacements in classical three dimensional elasticity theory can be set up in three ways 1 to solve for the displacements first and then the stresses 2 to solve for the stresses first and then the displacements and 3 to solve for both stresses and displacements simultaneously These three methods are identified in the literature as 1 the displacement method 2 the stress or force method and 3 the combined or mixed method Closed form solutions of the partial differential equations with their complicated boundary conditions for any of these three methods have been obtained only in special cases In order to obtain solutions various special methods have been developed to determine the stresses and displacements in structures The equations have been reduced to two and one dimensional forms for plates beams and trusses By neglecting the local effects at the edges and ends satisfactory solutions can be obtained for many case The procedures for reducing the three dimensional equations to two and one dimensional equations are described in Chapter 1 Volume 1 where the various approximations are pointed out Speednews ,1989 *Army RD & A Bulletin* ,1970 *Aeronautical Engineering* ,1991 *Smart Intelligent Aircraft Structures (SARISTU)* Piet Christof Wölcken,Michael Papadopoulos,2015-09-04 The book includes the research papers presented in the final conference of the EU funded SARISTU Smart Intelligent Aircraft Structures project held at Moscow Russia between 19 21 of May 2015 The SARISTU project which was launched in September 2011 developed and tested a variety of individual applications as well as their combinations With a strong focus on actual physical integration and subsequent material and structural testing SARISTU has been responsible for important progress on the route to industrialization of structure integrated functionalities such as Conformal Morphing Structural Health Monitoring and Nanocomposites The gap and edge free deformation of aerodynamic surfaces known as conformal morphing has gained previously unrealized capabilities such as inherent de icing erosion protection and lightning strike protection while at the same time the technological risk has been greatly reduced Individual

structural health monitoring techniques can now be applied at the part manufacturing level rather than via extending an aircraft's time in the final assembly line And nanocomposites no longer lose their improved properties when trying to upscale from neat resin testing to full laminate testing at element level As such this book familiarizes the reader with the most significant developments achievements and key technological steps which have been made possible through the four year long cooperation of 64 leading entities from 16 different countries with the financial support of the European Commission
