Understanding Decision-making Processes in Airline Operations Control Peter J. Bruce, 2016-02-17 Previous studies conducted within the aviation industry have examined a multitude of crucial aspects such as policy airline service quality and revenue management An extensive body of literature has also recognised the importance of decision making in aviation with the focus predominantly on pilots and air traffic controllers Understanding Decision Making Processes in Airline Operations Control focuses instead on an area largely overlooked an airline's Operations Control Centre OCC This serves as the nerve centre of the airline and is responsible for decision making with respect to operational control of an airline's daily schedules The environment within an OCC is extremely intense and a key role of controllers is to make decisions that facilitate the airline's recovery from frequent highly complex and often multiple disruptions As such decision making in this domain is critical to minimise the operational commercial and financial impact resulting from disruptions The book examines many aspects of individual decision making in airline operations and addresses the deficiencies found by presenting to the reader an examination of the relationships among situation awareness information completeness experience expertise decision considerations and decision alternatives in OCCs The text utilises a multiple case study approach and proposes a number of relevant and important implications for OCC management Practical outcomes highlight the need for enhancing training programs enabling existing controllers to readily identify and classify elements of situation awareness and decision considerations as a means of improving the decision making process They also draw attention to the need for airline OCCs to understand the extent to which industry experience and expertise of controllers is important in the selection of future staff

Complexity Science in Air Traffic Management Andrew Cook, Damián Rivas, 2016-06-03 Air traffic management ATM comprises a highly complex socio technical system that keeps air traffic flowing safely and efficiently worldwide every minute of the year Over the last few decades several ambitious ATM performance improvement programmes have been undertaken Such programmes have mostly delivered local technological solutions whilst corresponding ATM performance improvements have fallen short of stakeholder expectations In hindsight this can be substantially explained from a complexity science perspective ATM is simply too complex to address through classical approaches such as system engineering and human factors In order to change this complexity science has to be embraced as ATM's best friend The applicability of complexity science paradigms to the analysis and modelling of future operations is driven by the need to accommodate long term air traffic growth within an already saturated ATM infrastructure Complexity Science in Air Traffic Management is written particularly but not exclusively for transport researchers though it also has a complementary appeal to practitioners supported through the frequent references made to practical examples and operational themes such as performance airline strategy passenger mobility delay propagation and free flight safety The book should also have

significant appeal beyond the transport domain due to its intrinsic value as an exposition of applied complexity science and applied research drawing on examples of simulations and modelling throughout with corresponding insights into the design of new concepts and policies and the understanding of complex phenomena that are invisible to classical techniques

Airline Schedule Planning and Operations Lavanya Marla, 2010 We study strategic and operational measures of improving airline system performance and reducing delays for aircraft crew and passengers As a strategic approach we study robust optimization models which capture possible future operational uncertainties at the planning stage in order to generate solutions that when implemented are less likely to be disrupted or incur lower costs of recovery when disrupted We complement strategic measures with operational measures of managing delays and disruptions by integrating two areas of airline operations thus far separate disruption management and flight planning We study different classes of models to generate robust airline scheduling solutions In particular we study two general classes of robust models i extreme value robust optimization based and ii chance constrained probability based and one tailored model which uses domain knowledge to guide the solution process We focus on the aircraft routing problem a step of the airline scheduling process We first show how the general models can be applied to the aircraft routing problem by incorporating domain knowledge To overcome limitations of solution tractability and solution performance we present budget based extensions to the general model classes called the Delta model and the Extended Chance Constrained programming model Our models enhance tractability by reducing the need to iterate and re solve the models and generate solutions that are consistently robust compared to the basic models according to our performance metrics In addition tailored approaches to robustness can be expressed as special cases of these generalizable models The extended models and insights gleaned apply not only to the aircraft routing model but also to the broad class of large scale network based resource allocation We show how our results generalize to resource allocation problems in other domains by applying these models to pharmaceutical supply chain and corporate portfolio applications in collaboration with IBM s Zurich Research Laboratory Through empirical studies we show that the effectiveness of a robust approach for an application is dependent on the interaction between i the robust approach ii the data instance and iii the decision maker s and stakeholders metrics We characterize the effectiveness of the extreme value models and probabilistic models based on the underlying data distributions and performance metrics We also show

how knowledge of the underlying data distributions can indicate ways of tailoring model parameters to generate more robust solutions according to the specified performance metrics As an operational approach towards managing airline delays we integrate flight planning with disruption management We focus on two aspects of flight planning i flight speed changes and ii intentional flight departure holds or delays with the goal of optimizing the trade off between fuel costs and passenger delay costs We provide an overview of the state of the practice via dialogue with multiple airlines and show how greater flexibility in disruption management is possible through integration We present models for aircraft and passenger recovery combined with flight planning and models for approximate aircraft and passenger recovery combined with flight planning Our computational experiments on data provided by a European airline show that decrease in passenger disruptions on the order of 47 2% 53 3% can be obtained using our approaches We also discuss the relative benefits of the two mechanisms studied that of flight speed changes and that of intentionally holding flight departures and show significant synergies in applying these mechanisms We also show that as more information about delays and disruptions in the system is captured in our models further cost savings and reductions in passenger delays are obtained

Management in Airline Operations Control António J. M. Castro, Ana Paula Rocha, Eugénio Oliveira, 2014-06-19 Most of the research efforts dealing with airline scheduling have been done on off line plan optimization However nowadays with the increasingly complex and huge traffic at airports the real challenge is how to react to unexpected events that may cause plan disruptions leading to flight delays Moreover these disruptive events usually affect at least three different dimensions of the situation the aircraft assigned to the flight the crew assignment and often forgotten the passengers journey and satisfaction This book includes answers to this challenge and proposes the use of the Multi agent System paradigm to rapidly compose a multi faceted solution to the disruptive event taking into consideration possible preferences of those three key aspects of the problem Negotiation protocols taking place between agents that are experts in solving the different problem dimensions combination of different utility functions and not less important the inclusion of the human in the automatic decision making loop make MASDIMA the system described in this book well suited for real life plan disruption management applications

Airline Operations and Scheduling Dr Massoud Bazargan, 2012-10-01 This book demystifies operations and scheduling within airlines presenting easy to understand models applied to practical examples After introducing the key issues it offers an objective review of the various optimization models adopted in practice Each model provides solutions to a range of scenarios with case studies similar to those experienced by commercial airlines Using unique source material and interviews with alumni working at operations and scheduling departments of various airlines this solution orientated approach has been used on many courses with outstanding feedback
