The Theory of Relativity

In 1915, Albert Einstein revolutionized physics. He described in the General Theory of Relativity how gravity arises when space and time writhe.

In November 1915 Albert Einstein explained a radically new world view to the Prussian Academy of Sciences with the General Theory of Relativity. Accordingly, masses and rays of light do not merely move through space and time - space and time themselves merge into a structure that constantly curves and changes. Heavy bodies distort their geometry, even light then runs on curved tracks. Extreme consequences are such exotic objects as black holes, the researchers have not understood until today, or gravitational waves whose direct detection still failed. And how Einstein's cosmos could be reconciled with the equations of quantum physics - this will probably be one of the greatest tasks of theoretical physics of the current century.

The theory of relativity is essentially about experiencing two objects that move relative to one another, hence the name: theory of relativity. The effects of relativity occur only at high speeds, at velocities comparable to the speed of light: time increases, scales shorten, and the mass of the moving object increases. This is described in the "special theory of relativity". The second possibility: they occur in the presence of large masses. This is described in the "general theory of relativity".

In addition: $E = mc^2$, which means that energy is "equivalent" to the mass. Energy can be converted to mass, and vice versa. This is the so-called "mass defect". When light atomic nuclei fuse (hydrogen to helium), the final product is slightly lighter, some of the mass has been converted to energy and

released. Or when heavy atomic nuclei decay - some of the mass has been converted to energy, the end products are slightly lighter than all the ingredients.

How come?

Before the theory of relativity existed, it was thought that space and time are absolute. They do not change. They went in search of the "absolute cosmic platform", something to which one can relate his speed. As a person on the train goes at 5 km / h. But compared to the platform at 105 km / h, when the train itself runs at 100 km / h. It was thought that the "ether" would be such a suitable quiet thing. It fills the entire universe, is absolutely transparent, because the light penetrates, and is the carrier of light, which has a very high speed - so the ether would have to be extremely "tough", because only so a substance allows such high speeds. Michelson-Morley set out with a famous experiment to search for this ether - and they proved that it does not exist. There is therefore no absolute speed, only relative speeds of objects to each other. If you think that over, and Einstein did that, you get very peculiar results that made a change in the physical world picture necessary.

The requirements

The theory of relativity assumes that the speed of light is always and everywhere the same: around 300,000 km / s. That's 7 1/2 times around the earth in one second. And in addition, something amazing: Whether you fire a flashlight from a fast spaceship, or from a moving train, or from the armchair in the room - it always has this timidity. From this Einstein concluded:

Details

When a traveler moves relative to an observer, the observer will notice:

1. The time of the traveler is extended.
2. Its distances in flight direction are shortened.
3. The mass of the traveler increases.
4. The "simultaneity" is also not very clear. What is simultaneous, when light needs time to move through the universe?

These are the effects of the "special theory of relativity". It describes the behavior of space and time from the point of

Albert Einstein Research Papers:

The Swiss Years Albert Einstein, 1995 This volume presents Einstein's writings from the final period of his work in Switzerland. Most of the material in Volume 4 documents Einstein's search for a relativistic theory of gravitation, a search that ended in Berlin in the fall of 1915 with the completion of the general theory of relativity. Three scientific manuscripts printed here for the first time provide insights into Einstein's efforts to generalize his original relativity theory into a theory of gravitation. The first is a review article on the special theory of relativity. The second consists of notes that document Einstein's research on gravitation. The third manuscript contains calculations on the problem of the motion of the perihelion of Mercury. The explanation of the observed anomaly of this motion was to become one of the classical tests of general relativity. The existence of such a manuscript has not been known before now. All three of these manuscripts, along with other material in this volume, add significantly to our understanding of the creation of general relativity. **Einstein's Miraculous Year**

Albert Einstein, 2005-04-17 After 1905 physics would never be the same. In those 12 months Einstein shattered many cherished scientific beliefs with five great papers that would establish him as the world's leading physicist. On their 100th anniversary, this book brings those papers together in an accessible format. **The Collected Papers of Albert Einstein, Volume 4 (English)**

Albert Einstein's insights into how the universe works were first revealed in 1905 with the publication of four monographs. One of these was his study *On the Electrodynamics of Moving Bodies*, which introduced his theory of gravitation and his view on special relativity. Continuing his inquiries, he found special relativity too restrictive and so formulated his theory of general relativity in the publication of *On the Relativity Principle and the Conclusions Drawn from It* in 1907. A few years later he posited his general theory of relativity in his paper *On the Influence of Gravitation on the Propagation of Light*, published in 1911. Following the validation of Einstein's theories during the solar eclipse of May 29, 1919, this edition of *Relativity*, a translation of an earlier work published in Germany, was

published by Methuen in the UK and Henry Holt in the US It and the award of the 1921 Nobel Prize in Physics brought Einstein's theories to the attention of the general public *Essays in Science* Albert Einstein, 1934 *The Collected Papers of Albert Einstein, Volume 13* Albert Einstein, 1987 A translation of selected non English texts included in Volume 13 is available in paperback Since this supplementary paperback includes only select portions of Volume 13 it is not recommended for purchase without the main volume Every document in *The Collected Papers of Albert Einstein* appears in the language in which it was written and this supplementary paperback volume presents the English translations of select portions of non English materials in Volume 13 This translation does not include notes or annotation of the documentary volume and is not intended for use without the original language documentary edition which provides the extensive editorial commentary necessary for a full historical and scientific understanding of the documents *Einstein's Pathway to the Special Theory of Relativity* Galina Weinstein, 2015-06-18 This book pieces together the jigsaw puzzle of Einstein's journey to discovering the special theory of relativity Between 1902 and 1905 Einstein sat in the Patent Office and may have made calculations on old pieces of paper that were once patent drafts One can imagine Einstein trying to hide from his boss writing notes on small sheets of paper and according to reports seeing to it that the small sheets of paper on which he was writing would vanish into his desk drawer as soon as he heard footsteps approaching his door He probably discarded many pieces of papers and calculations and flung them in the waste paper basket in the Patent Office The end result was that Einstein published nothing regarding the special theory of relativity prior to 1905 For many years before 1905 he had been intensely concerned with the topic in fact he was busily working on the problem for seven or eight years prior to 1905 Unfortunately there are no surviving notebooks and manuscripts no notes and papers or other primary sources from this critical period to provide any information about the crucial steps that led Einstein to his great discovery In May 1905 Henri Poincaré sent three letters to Hendrik Lorentz at the same time that Einstein wrote his famous May 1905 letter to Conrad Habicht promising him four works of which the fourth one *Relativity* was a rough draft at that point In the May 1905 letters to Lorentz Poincaré presented the basic equations of his 1905 *Dynamics of the Electron* meaning that at this point Poincaré and Einstein both had drafts of papers relating to the principle of relativity The book discusses Einstein's and Poincaré's creativity and the process by which their ideas developed The book also explores the misunderstandings and paradoxes apparent in the theory of relativity and unravels the subtleties and creativity of Einstein ***The Collected Papers of Albert Einstein*** , 1994 This volume of *The Collected Papers of Albert Einstein* presents Einstein's writings for the two year period starting in October 1909 The initial date marks Einstein's departure from the Swiss Patent Office at Bern which had been his professional home for seven years and the beginning of his first academic appointment at the University of Zurich The volume concludes with the masterful report that Einstein by then a full professor at the German language university in Prague gave to the original Solvay Congress the first international meeting devoted to the problems of radiation and the quantum theory Most of Einstein's

efforts during these years went into his struggle with these ever more perplexing problems of quanta on which he made discouragingly little progress Einstein's new academic career naturally required him to teach and almost half of this volume consists of the previously unpublished notes he wrote in preparation for his lectures on mechanics on electricity and magnetism and on kinetic theory and statistical mechanics The last of these is particularly interesting in reflecting some of his research interests Several papers here are concerned with aspects of the special theory of relativity but it is Einstein's article of June 1911 that is a harbinger of things to come it contains his calculation of the bending of light in a gravitational field on the basis of his equivalence principle Martin J Klein is Bass Professor of the History of Science and Professor of Physics at Yale University and Senior Editor of *The Collected Papers of Albert Einstein* A J Kox teaches history of science at the University of Amsterdam J rgen Renn is Assistant Professor of Philosophy and Physics at Boston University and Robert Schulmann is Assistant Professor of History at Boston University

The collected papers of Albert Einstein, 1996 This volume presents Einstein's writings from the final period of his work in Switzerland Most of the material in Volume 4 documents Einstein's search for a relativistic theory of gravitation a search that ended in Berlin in the fall of 1915 with the completion of the general theory of relativity Three scientific manuscripts printed here for the first time provide insight into Einstein's efforts to generalize his original relativity theory into a theory of gravitation The first is a review article on the special theory of relativity The second consists of notes that document Einstein's research on gravitation The third manuscript contains calculations on the problem of the motion of the perihelion of Mercury The explanation of the observed anomaly of this motion was to become one of the classical tests of general relativity The existence of such a manuscript has not been known before now All three of these manuscripts along with other material in this volume add significantly to our understanding of the creation of general relativity This supplementary paperback volume presents only the English translations of non English materials and is not intended for use without the original language documentary edition

The Collected Papers of Albert Einstein, Volume 2 Albert Einstein, 1990-02 This volume of *The Collected Papers of Albert Einstein* contains the scientific work Einstein published during the first decade of his career and includes some of the most significant achievements of twentieth century physics The first paper was written in 1900 by the twenty one year old Einstein newly graduated from the Swiss Federal Polytechnical School or ETH in Zurich and still searching in vain for a job The last paper in this volume is the text of an invited lecture given in 1909 to a major scientific meeting by Einstein after he was appointed to his first academic post at the University of Zurich He had already been recognized as an important theoretical physicist on the basis of the work reprinted here particularly the three masterpieces that appeared in quick succession during 1905 Einstein's year of miracles In one of these papers Einstein showed how one could finally confirm the ancient view that matter is composed of discrete atoms and even measure the numbers and masses of these atoms In a second paper which even he referred to as very revolutionary he argued that the observed properties of thermal radiation suggest that it consists not of

waves but rather of localized particles of energy which he called energy quanta The third and most famous paper set forth the special theory of relativity solving some long standing difficulties but requiring a significant change in our understanding of those basic concepts space and time
