

The Problem

One of our original goals in developing the Maximum-Flow Problem was to be able to solve the Bipartite Matching Problem, and we now show how to do this. Recall that a *bipartite graph* $G = (V, E)$ is an undirected graph whose node set can be partitioned as $V = X \cup Y$, with the property that every edge $e \in E$ has one end in X and the other end in Y . A *matching* M in G is a subset of the edges $M \subseteq E$ such that each node appears in at most one edge in M . The Bipartite Matching Problem is that of finding a matching in G of largest possible size.

Designing the Algorithm

The graph defining a matching problem is undirected, while flow networks are directed; but it is actually not difficult to use an algorithm for the Maximum-Flow Problem to find a maximum matching.

Beginning with the graph G in an instance of the Bipartite Matching Problem, we construct a flow network G' as shown in Figure 7.9. First we direct all edges in G from X to Y . We then add a node s , and an edge (s, x) from s to each node in X . We add a node t , and an edge (y, t) from each node in Y to t . Finally, we give each edge in G' a capacity of 1.

We now compute a maximum s - t flow in this network G' . We will discover that the value of this maximum is equal to the size of the maximum matching in G . Moreover, our analysis will show how one can use the flow itself to recover the matching.

Figure 7.9 (a) A bipartite graph. (b) The corresponding flow network, with all capacities equal to 1.

The Digital Humanist Domenico Fiormonte,Teresa Numerico,Francesca Tomasi,2015 This book offers a critical introduction to the core technologies underlying the Internet from a humanistic perspective It provides a cultural critique of computing technologies by exploring the history of computing and examining issues related to writing representing archiving and searching The book raises awareness of and calls for the digital humanities to address the challenges posed by the linguistic and cultural divides in computing the clash between communication and control and the biases inherent in networked technologies A common problem with publications in the Digital Humanities is the dominance of the Anglo American perspective While seeking to take a broader view the book attempts to show how cultural bias can become an obstacle to innovation both in the methodology and practice of the Digital Humanities Its central point is that no technological instrument is culturally unbiased and that all too often the geography that underlies technology coincides with the social and economic interests of its producers The alternative proposed in the book is one of a world in which variation contamination and decentralization are essential instruments for the production and transmission of digital knowledge It is thus necessary not only to have spaces where DH scholars can interact such as international conferences THATCamps forums and mailing lists but also a genuine sharing of technological know how and experience This is a truly exceptional work on the subject of the digital Students and scholars new to the field of digital humanities will find in this book a gentle introduction to the field which I cannot but think would be good and perhaps even inspirational for them Its history of the development of machines and programs and communities bent on using computers to

advance science and research merely sets the stage for an insightful analysis of the role of the digital in the way both scholars and everyday people communicate and conceive of themselves and others in written forms from treatises to credit card transactions
