involves considerable interaction between various mathematical disciplines including theory of computation statistics and combinatorics There is also considerable interaction with the practical empirical fields of machine and statistical learning in which a principal aim is to predict from past data about phenomena useful features of future data from the same phenomena The papers in this volume cover a broad range of topics of current research in the field of algorithmic learning theory We have divided the 29 technical contributed papers in this volume into eight categories corresponding to eight sessions reflecting this broad range The categories featured are Inductive Inference Approximate Optimization Algorithms Online Sequence Prediction Statistical Analysis of Unlabeled Data PAC Learning Boosting Statistical supervised Learning Logic Based Learning and Query Reinforcement Learning Below we give a brief overview of the field placing each of these topics in the general context of the field Formal models of automated learning reflect various facets of the wide range of activities that can be viewed as learning A first dichotomy is between viewing learning as an indefinite process and viewing it as a finite activity with a defined termination Inductive Inference models focus on indefinite learning processes requiring only eventual success of the learner to converge to a satisfactory conclusion
