SQL and Relational Theory C.J. Date, 2009-01-23 Understanding SQL's underlying theory is the best way to guarantee that your SQL code is correct and your database schema is robust and maintainable. On the other hand, if you're not well versed in the theory, you can fall into several traps. In *SQL and Relational Theory*, author C.J. Date demonstrates how you can apply relational theory directly to your use of SQL. With numerous examples and clear explanations of the reasoning behind them, you'll learn how to deal with common SQL dilemmas such as: Should database access be granted through views instead of base tables? Nulls in your database are causing you to get wrong answers. Why? What can you do about it? Could you write an SQL query to find employees who have never been in the same department for more than six months at a time? SQL supports quantified comparisons, but they're better avoided. Why? How do you avoid them? Constraints are crucially important, but most SQL products don't support them properly. What can you do to resolve this situation? Database theory and practice have evolved since Edgar Codd originally defined the relational model back in 1969. Independent of any SQL products, *SQL and Relational Theory* draws on decades of research to present the most up-to-date treatment of the material available anywhere. Anyone with a modest to advanced background in SQL will benefit from the many insights in this book.

Database and Expert Systems Applications Dimitris Karagiannis, 2013-11-11 The Database and Expert Systems Applications DEXA conferences are dedicated to providing an international forum for the presentation of applications in the database and expert systems field for the exchange of ideas and experiences and for defining requirements for the future systems in these fields After the very promising DEXA 90 in Vienna Austria we hope to have successfully established with this year's DEXA 91 a stage where scientists from diverse fields interested in application oriented research can present and discuss their work This year there was a total of more than 250 submitted papers from 28 different countries in all continents Only 98 of the papers could be accepted The collection of

papers in these proceedings offers a cross section of the issues facing the area of databases and expert systems i.e. topics of basic research interest on one hand and questions occurring when developing applications on the other. Major credit for the success of the conference goes to all of our colleagues who submitted papers for consideration and to those who have organized and chaired the panel sessions. Many persons contributed numerous hours to organize this conference. The names of most of them will appear on the following pages. In particular we wish to thank the Organization Committee Chairmen Johann Gordes, A. Min Tjoa and Roland Wagner who also helped establishing the program. The NCL Natural Constraint Language Jianyang Zhou, 2012-12-09. The NCL Natural Constraint Language presents the NCL language which is a description language in conventional mathematical logic for modeling and solving constraint satisfaction problems. NCL differs from other declarative languages. It models problems naturally in a simplified form of first order logic with quantifiers, Boolean logic, numeric constraints, set operations and logical functions. It solves problems by mixed set programming over the mixed domain of real numbers, integers, Booleans, dates, times, references and, in particular, sets. The book uses plenty of examples and tutorials to illustrate NCL and its applications. It is intended for researchers and developers in the fields of logic programming, constraint programming, optimization, modeling, operations research and artificial intelligence who will learn from a new programming language and theoretical foundations for industrial applications. Dr. Jianyang Zhou is the inventor of NCL and has worked for its industrialization for more than 10 years. **Schema Matching and Mapping** Zohra Bellahsene, Angela Bonifati, Erhard Rahm, 2011-02-14. Requiring heterogeneous information systems to cooperate and communicate has now become crucial, especially in application areas like e-business, Web-based mash-ups and the life sciences. Such cooperating systems have to automatically and efficiently match, exchange, transform and integrate large data sets from different sources and of different structure in order to enable seamless data exchange and transformation. The book, edited by Bellahsene, Bonifati and Rahm, provides an overview of the ways in which the schema and ontology matching and mapping tools have addressed the above requirements and points to the open technical challenges. The contributions from leading experts are structured into three parts: large scale and knowledge driven schema matching

quality driven schema mapping and evolution and evaluation and tuning of matching tasks The authors describe the state of the art by discussing the latest achievements such as more effective methods for matching data mapping transformation verification adaptation to the context and size of the matching and mapping tasks mapping driven schema evolution and merging and mapping evaluation and tuning The overall result is a coherent comprehensive picture of the field With this book the editors introduce graduate students and advanced professionals to this exciting field For researchers they provide an up to date source of reference about schema and ontology matching schema and ontology evolution and schema merging
