A NAT configuration window is open, showing details for a NAT rule named 'NAT_outside_PAT'. The configuration includes the NAT model, IP address, and various layers of the packet structure. A simulation log window is also open, showing the results of a simulation with ping traffic. The log text is as follows:

```

 - Layer 2:** Port: FastEthernet0/0
- Simulation Log:**
 - The routing table finds a routing entry to the destination IP address.
 - The router decrements the TTL on the packet.
 - The packet is going from an inside to an outside network. The router looks up its NAT table for necessary translations.
 - The NAT table does not have existing translations with the inside local address and port. It goes through the inside source list for necessary translations.
 - An inside source entry is created from a list. The new entry is added to the NAT table.
 - The NAT table has a matched entry for this packet. It replaces the inside local address and port with the global ones.
 - The outgoing port has an outbound traffic access list with an ID of 1. The router checks the packet against the access list.
