

CLINICAL LABORATORY TESTS – REFERENCE VALUES

This table lists reference ranges (expressed in both SI units and traditional units) for the most common laboratory tests and is intended for interpretation of the results as they are provided in the examinations. Most of the values apply to adults and where they differ for children it will be indicated. Many important laboratory reference values are not listed here, because of the less frequent use of these tests. Such values are inserted parenthetically following the result recorded in the examination question.

Clinical Biochemistry in Hepatobiliary Diseases Francesco Salvatore, Aldo Roda, Lucia Sacchetti, 2013-03-07 The clinical biochemistry of hepatobiliary diseases is very widely studied and publications abound on this topic However there is no recent publication that provides a comprehensive collection of the various leading aspects that go to make up this complex theme Therefore we thought it useful to gather together a few scientists whose work has focused on the various clinical biochemistry aspects of these disorders in order that they might discuss their experience and expertise The aim of the International Satellite Symposium on Clinical Biochemistry in Hepatobiliary Disease in addition to reviewing the individual aspects was to describe the state of the art so as to provide useful data for laboratory scientists and also for physicians working in the field of hepatobiliary diseases and these two aims are clearly reflected in the chapters of this volume The volume opens with an introductory chapter that gives a general overview of the various aspects of the clinical biochemistry of these disorders while the closing chapter deals with an important aspect that deserves to be increasingly emphasized in laboratory medicine i e strategies to integrate information coming from the laboratory to make them more useful for clinical diagnosis

Circulating levels and assessment of clinical laboratory analytes, in >80-year-old, apparently healthy, moderately healthy, and frail individuals

Maria Edvardsson, 2019-09-09 Blood samples are often used to investigate the possible presence of disease and to make treatment decisions In the interpretation of the results comparison either with previous values from the same individual or with a set of appropriate group based reference intervals are used Current reference intervals for common laboratory analytes are often based on measurements from apparently healthy persons aged 18-65 years Age is accompanied by a general decline in organ functions and it is difficult to determine whether a change in levels of laboratory analytes in an elderly individual can be attributed to age alone independent of environmental or disease processes Frailty can be seen as a consequence of age related multifactorial deterioration physical cognitive and sensory resulting in vulnerability and lack of adaptability to internal stressors such as infection or new medication and or external stressors such as fall at home

Consensus about the definition of frail and frailty is missing both nationally and internationally the question arises whether different definitions of frailty affect the interpretation of analytes when comparing different groups of elderly The overarching aim of the thesis was to interpret and assess circulating levels of some clinical laboratory analytes in relation to conventional reference values in 80 year old apparently healthy moderately healthy and frail individuals Data originated from other studies in which blood samples were collected from individuals 80 year old Comparisons in Paper I of levels of some laboratory analytes from 138 nursing home residents NHRs was made with blood from reference populations both blood donor and the NORIP study The results indicated differences for some immunological complement factor 3 and 4 immunoglobulin G and M and chemical analytes alanine aminotransferase ALT phosphate albumin sodium creatinine and urea but no differences in levels occurred for aspartate aminotransferase AST gamma glutamyltransferase GT or lactate dehydrogenase LDH It was unclear whether the differences were due to differences in age between the elderly and the reference populations or whether the elderly individuals had chronic diseases and were on medication In Paper II 569 individuals elderly individuals 80 years old were classified as healthy moderately healthy and frail based on diseases medications and physical and cognitive abilities Statistical differences between the groups were found for the investigated analytes albumin ALT AST creatinine and GT In Paper IV individuals from Paper II n 569 were divided into two groups and thereafter divided into apparently healthy moderately healthy and frail One group was subdivided into apparently healthy moderately healthy and frail based on physical and cognitive abilities and the other group was divided based on the frailty index FI There was no statistical difference found between apparently healthy and moderately healthy groups regardless of

classification model used Among frail individuals differences in levels occurred for three out of the five investigated analytes ALT creatinine and g GT with lower levels occurring when the FI classification model was used No differences in levels occurred for albumin or AST in frail individuals regardless of classification model used The aim of Paper III was to study whether 1 year changes in complete blood count CBC including haemoglobin Hb red blood cell RBC erythrocyte volume fraction EVF mean corpuscular volume MCV mean corpuscular Hb concentration MCHC white blood cell WBC and platelet count PLT C reactive protein CRP and interleukin IL 1 IL 1RA IL 6 IL 8 and IL 10 are associated with survival in elderly NHRs aged 80 years Elevated levels of CRP and IL 8 during 1 year follow up were associated with reduced length of survival in elderly NHRs Based on the present thesis it is clear that there is need for reference intervals that consider both age and health status in elderly individuals A reasonable conclusion when interpreting levels of analytes in elderly individuals with disease or frailty is that individual evaluation based on the individual s previous levels is recommended Blodprover anvnds ofta fr att underska evf rekommendationer av sjukdomar och fr att fatta behandlingsbeslut Vid tolkningen av resultaten anvnds jmfrelse antingen med tidigare vrdn fr n samma individ eller med en upps tning l mpliga gruppbaseade referensintervall Nuvarande referensintervall fr vanliga laboratorieanalyser baseras ofta p m tningar fr n tillsynes friska personer i lder 18 65 r lder n tf ljs av en allm n nedg ng i organfunktioner och det r sv rt att avg ra om en ev f r ndring av niverna av laboratorieanalyterna kan enbart beror p skillnaden i lder oberoende av milj eller sjukdomsprocesser Sk rhet kan ses som en konsekvens av ldersrelaterad multifaktoriell f rs mring fysisk kognitiv och sensorisk vilket resulterar i s rbarhet och brist p anpassningsf rm ga till interna stressfaktorer som infektion eller ny medicinering och eller yttre stressorer s som att ramla hemma Konsensus om definitionen av sk rhet saknas b de nationellt och internationellt och fr gan uppstod om olika definitioner av sk rhet p verkar tolkningar och referensintervall fr laboratorieanalyser n r man j mf r olika grupper av ldre individer Det vergripande syftet med avhandlingen var att tolka och bed ma cirkulerande niv er fr n gra kliniska laboratorieanalyser i f rh llande till g llande referensv rden hos 80 riga h lsosamma m ttligt friska och sk ra individer Data kommer fr n andra studier inom vilka blodprov samlades alla fr n individer 80 r J mf relser i studie I gjordes mellan blodprover fr n 138 individer i s rskilt boende med blodprover fr n referenspopulationer b de blodgivare och fr n NORIP studien Resultaten visade skillnader fr n vissa immunologiska komplementfaktor 3 och 4 och kemiska analyser alaninaminotransferas Alat fosfat albumin natrium kreatinin och urea men inte alla aspartataminotransferas Asat gamma glytamytransferas GT eller laktatdehydrogenas LD Det var oklart om skillnaderna berodde p skillnader i lder mellan de ldre och referenspopulationerna eller om de ldre individerna hade kroniska sjukdomar och medicinerade I studie II klassificerades 569 individer 80 r som h lsosamma m ttligt friska och sk ra baserat p sjukdomar medicinering och fysiska och kognitiva f rm gor Statistiska skillnader mellan grupperna hittades fr n de unders kta analyterna albumin Alat Asat kreatinin och y GT I studie IV delades individer fr n papper II n 569 in i tv grupper och delades d refter upp i h lsosamma m ttligt friska och sk ra
