Automatic Layout Synthesis for High-performance Full Custom VLSI Chips Jaewon Kim,University of Illinois at Urbana-Champaign. Department of Computer Science,1995 Abstract As the technology advances millions of transistors can be integrated on a small chip area With the trend the physical layout synthesis by human designers becomes costly and error prone due to the various design constraints Therefore the demands for intelligent tools have been increasing to create physical layouts for custom logic design We developed an automatic layout synthesis system for high performance full custom circuits In this thesis we introduce our synthesis system in conjunction with related problems and solutions Most of the problems in physical layout synthesis namely leaf cell construction partitioning placement global routing detailed routing and transistor gate sizing are addressed in our synthesis system All necessary leaf cells are individually synthesized with customized transistor sizes before placement and tuned after detailed routing We developed various techniques for the leaf cell synthesis to match layout experts such as transistor folding transistor ordering contact placement and transistor sizing In partitioning and placement we concentrated our effort on data path circuits which is one of the currently popular topics For detailed routing a triple metal layer over the cell router has been developed for a popular platform Our synthesis system iteratively improves the layout until given requirements are satisfied We tested our system with various benchmark circuits to measure the performance Also a whole chip layout including bonding pads for DSP circuits has been synthesized with a hierarchical
