Process Heat Transfer is a reference on the design and implementation of industrial heat exchangers. It provides the background needed to understand and master the commercial software packages used by professional engineers in the design and analysis of heat exchangers. This book focuses on types of heat exchangers most widely used by industry: shell and tube exchangers, including condensers, reboilers, and vaporizers; air-cooled heat exchangers; and double pipe hairpin exchangers. It provides a substantial introduction to the design of heat exchanger networks using pinch technology, the most efficient strategy used to achieve optimal recovery of heat in industrial processes. Utilizes leading commercial software. Get expert HTRI Xchanger Suite guidance, tips and tricks previously available via high cost professional training sessions. Details the development of initial configuration for a heat exchanger and how to systematically modify it to obtain an efficient final design. Abundant case studies and rules of thumb, along with copious software examples, provide a complete library of reference designs and heuristics for readers to base their own designs on.

Fuselage-drag Tests in the Variable-density Wind Tunnel Ira H. A. Abbott, 1937. Results are presented on drag tests of six bodies of revolution with systematically varying shapes and with a fineness ratio of 5. The forms were derived from source-sink distributions and formulas are presented for the calculation of the pressure distributions of the forms. The tests were made in the NACA variable density tunnel over a range of values of Reynolds number from about 1 500 000 to 25 000 000. The results show that the bodies with the sharper noses and tails have the lowest drag coefficients, are based on the two-thirds power of the volume. The data show the most important single characteristic of the body form to be the tail angle, which must be fine to obtain low drag.
